PART 1

Getting Started with the ASA

CHAPTER 1

Introduction to the Cisco ASA 5500 Series **1-1**

Hardware and Software Compatibility **1-1**

VPN Specifications **1-1**

New Features **1-1**

New Features in Version 8.4(3) **1-2**

New Features in Version 8.4(2) **1-4**

New Features in Version 8.4(1) **1-9**

Firewall Functional Overview **1-14**

Security Policy Overview **1-14**

Permitting or Denying Traffic with Access Lists **1-15**

Applying NAT **1-15**

Protecting from IP Fragments **1-15**

Using AAA for Through Traffic **1-15**

Applying HTTP, HTTPS, or FTP Filtering **1-15**

Applying Application Inspection **1-15**

Sending Traffic to the IPS Module **1-15**

Sending Traffic to the Content Security and Control Module **1-16**

Applying QoS Policies **1-16**

Applying Connection Limits and TCP Normalization **1-16**

Enabling Threat Detection **1-16**

Enabling the Botnet Traffic Filter **1-16**

Configuring Cisco Unified Communications **1-17**

Firewall Mode Overview **1-17**

Stateful Inspection Overview **1-17**

VPN Functional Overview **1-18**

Security Context Overview 1-19

CHAPTER 2**Getting Started 2-1**

- Accessing the Appliance Command-Line Interface 2-1
- Configuring ASDM Access for Appliances 2-2
 - Accessing ASDM Using the Factory Default Configuration 2-2
 - Accessing ASDM Using a Non-Default Configuration (ASA 5505) 2-3
 - Accessing ASDM Using a Non-Default Configuration (ASA 5510 and Higher) 2-5
- Starting ASDM 2-6
 - Connecting to ASDM for the First Time 2-7
 - Starting ASDM from the ASDM-IDM Launcher 2-8
 - Starting ASDM from the Java Web Start Application 2-8
 - Using ASDM in Demo Mode 2-9
- Factory Default Configurations 2-10
 - Restoring the Factory Default Configuration 2-11
 - ASA 5505 Default Configuration 2-11
 - ASA 5505 Routed Mode Default Configuration 2-11
 - ASA 5505 Transparent Mode Sample Configuration 2-13
 - ASA 5510 and Higher Default Configuration 2-15
- Working with the Configuration 2-15
 - Saving Configuration Changes 2-16
 - Saving Configuration Changes in Single Context Mode 2-16
 - Saving Configuration Changes in Multiple Context Mode 2-16
 - Copying the Startup Configuration to the Running Configuration 2-17
 - Viewing the Configuration 2-18
 - Clearing and Removing Configuration Settings 2-18
 - Creating Text Configuration Files Offline 2-19
- Applying Configuration Changes to Connections 2-19

CHAPTER 3**Managing Feature Licenses 3-1**

- Supported Feature Licenses Per Model 3-1
 - Licenses Per Model 3-1
 - License Notes 3-11
 - VPN License and Feature Compatibility 3-15
- Information About Feature Licenses 3-15
 - Preinstalled License 3-16
 - Permanent License 3-16
 - Time-Based Licenses 3-16
 - Time-Based License Activation Guidelines 3-16

How the Time-Based License Timer Works	3-16
How Permanent and Time-Based Licenses Combine	3-17
Stacking Time-Based Licenses	3-18
Time-Based License Expiration	3-18
Shared AnyConnect Premium Licenses	3-18
Information About the Shared Licensing Server and Participants	3-19
Communication Issues Between Participant and Server	3-20
Information About the Shared Licensing Backup Server	3-20
Failover and Shared Licenses	3-20
Maximum Number of Participants	3-22
Failover Licenses (8.3(1) and Later)	3-23
Failover License Requirements	3-23
How Failover Licenses Combine	3-23
Loss of Communication Between Failover Units	3-24
Upgrading Failover Pairs	3-24
No Payload Encryption Models	3-25
Licenses FAQ	3-25
Guidelines and Limitations	3-26
Configuring Licenses	3-27
Obtaining an Activation Key	3-27
Activating or Deactivating Keys	3-28
Configuring a Shared License	3-30
Configuring the Shared Licensing Server	3-30
Configuring the Shared Licensing Backup Server (Optional)	3-31
Configuring the Shared Licensing Participant	3-32
Monitoring Licenses	3-33
Viewing Your Current License	3-33
Monitoring the Shared License	3-39
Feature History for Licensing	3-41

PART 2

Configuring Firewall and Security Context Modes

CHAPTER 4

Configuring the Transparent or Routed Firewall 4-1

Configuring the Firewall Mode	4-1
Information About the Firewall Mode	4-1
Information About Routed Firewall Mode	4-2
Information About Transparent Firewall Mode	4-2
Licensing Requirements for the Firewall Mode	4-6
Default Settings	4-6

Guidelines and Limitations	4-6
Setting the Firewall Mode	4-8
Feature History for Firewall Mode	4-9
Configuring ARP Inspection for the Transparent Firewall	4-9
Information About ARP Inspection	4-10
Licensing Requirements for ARP Inspection	4-10
Default Settings	4-10
Guidelines and Limitations	4-10
Configuring ARP Inspection	4-11
Task Flow for Configuring ARP Inspection	4-11
Adding a Static ARP Entry	4-11
Enabling ARP Inspection	4-12
Monitoring ARP Inspection	4-12
Feature History for ARP Inspection	4-13
Customizing the MAC Address Table for the Transparent Firewall	4-13
Information About the MAC Address Table	4-13
Licensing Requirements for the MAC Address Table	4-14
Default Settings	4-14
Guidelines and Limitations	4-14
Configuring the MAC Address Table	4-14
Adding a Static MAC Address	4-15
Setting the MAC Address Timeout	4-15
Disabling MAC Address Learning	4-15
Monitoring the MAC Address Table	4-16
Feature History for the MAC Address Table	4-16
Firewall Mode Examples	4-16
How Data Moves Through the ASA in Routed Firewall Mode	4-17
An Inside User Visits a Web Server	4-17
An Outside User Visits a Web Server on the DMZ	4-18
An Inside User Visits a Web Server on the DMZ	4-19
An Outside User Attempts to Access an Inside Host	4-20
A DMZ User Attempts to Access an Inside Host	4-21
How Data Moves Through the Transparent Firewall	4-22
An Inside User Visits a Web Server	4-23
An Inside User Visits a Web Server Using NAT	4-24
An Outside User Visits a Web Server on the Inside Network	4-25
An Outside User Attempts to Access an Inside Host	4-26

CHAPTER 5

Configuring Multiple Context Mode	5-1
Information About Security Contexts	5-1
Common Uses for Security Contexts	5-2
Context Configuration Files	5-2
Context Configurations	5-2
System Configuration	5-2
Admin Context Configuration	5-2
How the ASA Classifies Packets	5-3
Valid Classifier Criteria	5-3
Classification Examples	5-4
Cascading Security Contexts	5-6
Management Access to Security Contexts	5-7
System Administrator Access	5-7
Context Administrator Access	5-8
Information About Resource Management	5-8
Resource Limits	5-8
Default Class	5-9
Class Members	5-10
Information About MAC Addresses	5-11
Default MAC Address	5-11
Interaction with Manual MAC Addresses	5-11
Failover MAC Addresses	5-11
MAC Address Format	5-12
Licensing Requirements for Multiple Context Mode	5-12
Guidelines and Limitations	5-13
Default Settings	5-14
Configuring Multiple Contexts	5-14
Task Flow for Configuring Multiple Context Mode	5-14
Enabling or Disabling Multiple Context Mode	5-15
Enabling Multiple Context Mode	5-15
Restoring Single Context Mode	5-15
Configuring a Class for Resource Management	5-16
Configuring a Security Context	5-18
Automatically Assigning MAC Addresses to Context Interfaces	5-23
Changing Between Contexts and the System Execution Space	5-23
Managing Security Contexts	5-24
Removing a Security Context	5-24
Changing the Admin Context	5-25
Changing the Security Context URL	5-25

Reloading a Security Context	5-26
Reloading by Clearing the Configuration	5-27
Reloading by Removing and Re-adding the Context	5-27
Monitoring Security Contexts	5-27
Viewing Context Information	5-28
Viewing Resource Allocation	5-29
Viewing Resource Usage	5-32
Monitoring SYN Attacks in Contexts	5-33
Viewing Assigned MAC Addresses	5-35
Viewing MAC Addresses in the System Configuration	5-36
Viewing MAC Addresses Within a Context	5-37
Configuration Examples for Multiple Context Mode	5-38
Feature History for Multiple Context Mode	5-39

PART 3**Configuring Interfaces****CHAPTER 6****Starting Interface Configuration (ASA 5510 and Higher) 6-1**

Information About Starting ASA 5510 and Higher Interface Configuration	6-1
Auto-MDI/MDIX Feature	6-2
Interfaces in Transparent Mode	6-2
Management Interface	6-2
Management Interface Overview	6-2
Management <i>Slot/Port</i> Interface	6-2
Using Any Interface for Management-Only Traffic	6-3
Management Interface for Transparent Mode	6-3
No Support for Redundant Management Interfaces	6-4
Redundant Interfaces	6-4
Redundant Interface MAC Address	6-4
EtherChannels	6-4
Channel Group Interfaces	6-4
Connecting to an EtherChannel on Another Device	6-5
Link Aggregation Control Protocol	6-6
Load Balancing	6-6
EtherChannel MAC Address	6-7
Licensing Requirements for ASA 5510 and Higher Interfaces	6-7
Guidelines and Limitations	6-8
Default Settings	6-10
Starting Interface Configuration (ASA 5510 and Higher)	6-10
Task Flow for Starting Interface Configuration	6-11

Converting In-Use Interfaces to a Redundant or EtherChannel Interface	6-12
Enabling the Physical Interface and Configuring Ethernet Parameters	6-21
Configuring a Redundant Interface	6-24
Configuring a Redundant Interface	6-24
Changing the Active Interface	6-26
Configuring an EtherChannel	6-26
Adding Interfaces to the EtherChannel	6-26
Customizing the EtherChannel	6-28
Configuring VLAN Subinterfaces and 802.1Q Trunking	6-29
Enabling Jumbo Frame Support (Supported Models)	6-31
Monitoring Interfaces	6-32
Configuration Examples for ASA 5510 and Higher Interfaces	6-32
Physical Interface Parameters Example	6-32
Subinterface Parameters Example	6-32
Multiple Context Mode Example	6-33
EtherChannel Example	6-33
Where to Go Next	6-33
Feature History for ASA 5510 and Higher Interfaces	6-34

CHAPTER 7

Starting Interface Configuration (ASA 5505) 7-1

Information About ASA 5505 Interfaces	7-1
Understanding ASA 5505 Ports and Interfaces	7-2
Maximum Active VLAN Interfaces for Your License	7-2
VLAN MAC Addresses	7-4
Power over Ethernet	7-4
Monitoring Traffic Using SPAN	7-4
Auto-MDI/MDIX Feature	7-4
Licensing Requirements for ASA 5505 Interfaces	7-4
Guidelines and Limitations	7-5
Default Settings	7-5
Starting ASA 5505 Interface Configuration	7-6
Task Flow for Starting Interface Configuration	7-6
Configuring VLAN Interfaces	7-6
Configuring and Enabling Switch Ports as Access Ports	7-7
Configuring and Enabling Switch Ports as Trunk Ports	7-9
Monitoring Interfaces	7-11
Configuration Examples for ASA 5505 Interfaces	7-11
Access Port Example	7-11

Trunk Port Example	7-12
Where to Go Next	7-13
Feature History for ASA 5505 Interfaces	7-13

CHAPTER 8

Completing Interface Configuration (Routed Mode) 8-1

Information About Completing Interface Configuration in Routed Mode	8-1
Security Levels	8-1
Dual IP Stack (IPv4 and IPv6)	8-2
Licensing Requirements for Completing Interface Configuration in Routed Mode	8-2
Guidelines and Limitations	8-4
Default Settings	8-5
Completing Interface Configuration in Routed Mode	8-5
Task Flow for Completing Interface Configuration	8-5
Configuring General Interface Parameters	8-6
Configuring the MAC Address and MTU	8-8
Configuring IPv6 Addressing	8-11
Information About IPv6	8-11
Configuring a Global IPv6 Address and Other Options	8-12
Allowing Same Security Level Communication	8-14
Monitoring Interfaces	8-15
Configuration Examples for Interfaces in Routed Mode	8-15
ASA 5505 Example	8-15
Feature History for Interfaces in Routed Mode	8-16

CHAPTER 9

Completing Interface Configuration (Transparent Mode) 9-1

Information About Completing Interface Configuration in Transparent Mode	9-1
Bridge Groups in Transparent Mode	9-1
Security Levels	9-2
Licensing Requirements for Completing Interface Configuration in Transparent Mode	9-2
Guidelines and Limitations	9-4
Default Settings	9-5
Completing Interface Configuration in Transparent Mode	9-6
Task Flow for Completing Interface Configuration	9-6
Configuring Bridge Groups	9-6
Configuring General Interface Parameters	9-7
Configuring a Management Interface (ASA 5510 and Higher)	9-10
Configuring the MAC Address and MTU	9-11
Configuring IPv6 Addressing	9-13

Information About IPv6	9-14
Configuring a Global IPv6 Address and Other Options	9-15
Allowing Same Security Level Communication	9-17
Monitoring Interfaces	9-18
Configuration Examples for Interfaces in Transparent Mode	9-18
Feature History for Interfaces in Transparent Mode	9-19

PART 4**Configuring Basic Settings****CHAPTER 10****Configuring the Hostname, Domain Name, Passwords, and Other Basic Settings 10-1**

Configuring the Hostname, Domain Name, and Passwords	10-1
Changing the Login Password	10-1
Changing the Enable Password	10-2
Setting the Hostname	10-2
Setting the Domain Name	10-3
Setting the Date and Time	10-3
Setting the Time Zone and Daylight Saving Time Date Range	10-3
Setting the Date and Time Using an NTP Server	10-4
Setting the Date and Time Manually	10-6
Configuring the Master Passphrase	10-6
Information About the Master Passphrase	10-6
Licensing Requirements for the Master Passphrase	10-7
Guidelines and Limitations	10-7
Adding or Changing the Master Passphrase	10-7
Disabling the Master Passphrase	10-9
Recovering the Master Passphrase	10-10
Feature History for the Master Passphrase	10-11
Configuring the DNS Server	10-11
Monitoring DNS Cache	10-12
DNS Cache Monitoring Commands	10-12
Feature History for DNS Cache	10-12

CHAPTER 11**Configuring DHCP 11-1**

Information About DHCP	11-1
Licensing Requirements for DHCP	11-1
Guidelines and Limitations	11-2
Configuring a DHCP Server	11-2
Enabling the DHCP Server	11-3

Configuring DHCP Options	11-4
Options that Return an IP Address	11-4
Options that Return a Text String	11-4
Options that Return a Hexadecimal Value	11-5
Using Cisco IP Phones with a DHCP Server	11-6
Configuring DHCP Relay Services	11-7
DHCP Monitoring Commands	11-8
Feature History for DHCP	11-8

CHAPTER 12

Configuring Dynamic DNS 12-1

Information about DDNS	12-1
Licensing Requirements for DDNS	12-2
Guidelines and Limitations	12-2
Configuring DDNS	12-2
Configuration Examples for DDNS	12-3
Example 1: Client Updates Both A and PTR RRs for Static IP Addresses	12-3
Example 2: Client Updates Both A and PTR RRs; DHCP Server Honors Client Update Request; FQDN Provided Through Configuration	12-3
Example 3: Client Includes FQDN Option Instructing Server Not to Update Either RR; Server Overrides Client and Updates Both RRs.	12-4
Example 4: Client Asks Server To Perform Both Updates; Server Configured to Update PTR RR Only; Honors Client Request and Updates Both A and PTR RR	12-5
Example 5: Client Updates A RR; Server Updates PTR RR	12-5
DDNS Monitoring Commands	12-6
Feature History for DDNS	12-6

PART 5

Configuring Objects and Access Lists

CHAPTER 13

Configuring Objects 13-1

Configuring Objects and Groups	13-1
Information About Objects and Groups	13-1
Information About Objects	13-2
Information About Object Groups	13-2
Licensing Requirements for Objects and Groups	13-2
Guidelines and Limitations for Objects and Groups	13-3
Configuring Objects	13-3
Configuring a Network Object	13-3
Configuring a Service Object	13-4
Configuring Object Groups	13-6

Adding a Protocol Object Group	13-6
Adding a Network Object Group	13-7
Adding a Service Object Group	13-8
Adding an ICMP Type Object Group	13-9
Nesting Object Groups	13-10
Removing Object Groups	13-11
Monitoring Objects and Groups	13-11
Feature History for Objects and Groups	13-12
Configuring Regular Expressions	13-12
Creating a Regular Expression	13-12
Creating a Regular Expression Class Map	13-15
Scheduling Extended Access List Activation	13-16
Information About Scheduling Access List Activation	13-16
Licensing Requirements for Scheduling Access List Activation	13-16
Guidelines and Limitations for Scheduling Access List Activation	13-16
Configuring and Applying Time Ranges	13-17
Configuration Examples for Scheduling Access List Activation	13-18
Feature History for Scheduling Access List Activation	13-18

CHAPTER 14
Information About Access Lists 14-1

Access List Types	14-1
Access Control Entry Order	14-2
Access Control Implicit Deny	14-3
IP Addresses Used for Access Lists When You Use NAT	14-3
Where to Go Next	14-3

CHAPTER 15
Adding an Extended Access List 15-1

Information About Extended Access Lists	15-1
Licensing Requirements for Extended Access Lists	15-1
Guidelines and Limitations	15-2
Default Settings	15-2
Configuring Extended Access Lists	15-3
Adding an Extended Access List	15-3
Adding Remarks to Access Lists	15-5
Monitoring Extended Access Lists	15-5
Configuration Examples for Extended Access Lists	15-5
Configuration Examples for Extended Access Lists (No Objects)	15-6
Configuration Examples for Extended Access Lists (Using Objects)	15-6

Where to Go Next	15-7
Feature History for Extended Access Lists	15-7

CHAPTER 16

Adding an EtherType Access List	16-1
Information About EtherType Access Lists	16-1
Licensing Requirements for EtherType Access Lists	16-1
Guidelines and Limitations	16-2
Default Settings	16-2
Configuring EtherType Access Lists	16-2
Task Flow for Configuring EtherType Access Lists	16-2
Adding EtherType Access Lists	16-3
Adding Remarks to Access Lists	16-4
What to Do Next	16-4
Monitoring EtherType Access Lists	16-4
Configuration Examples for EtherType Access Lists	16-5
Feature History for EtherType Access Lists	16-5

CHAPTER 17

Adding a Standard Access List	17-1
Information About Standard Access Lists	17-1
Licensing Requirements for Standard Access Lists	17-1
Guidelines and Limitations	17-1
Default Settings	17-2
Adding Standard Access Lists	17-3
Task Flow for Configuring Extended Access Lists	17-3
Adding a Standard Access List	17-3
Adding Remarks to Access Lists	17-4
What to Do Next	17-4
Monitoring Access Lists	17-4
Configuration Examples for Standard Access Lists	17-4
Feature History for Standard Access Lists	17-5

CHAPTER 18

Adding a Webtype Access List	18-1
Licensing Requirements for Webtype Access Lists	18-1
Guidelines and Limitations	18-1
Default Settings	18-2
Using Webtype Access Lists	18-2
Task Flow for Configuring Webtype Access Lists	18-2

Adding Webtype Access Lists with a URL String	18-3
Adding Webtype Access Lists with an IP Address	18-4
Adding Remarks to Access Lists	18-5
What to Do Next	18-5
Monitoring Webtype Access Lists	18-5
Configuration Examples for Webtype Access Lists	18-5
Feature History for Webtype Access Lists	18-7

CHAPTER 19

Adding an IPv6 Access List 19-1

Information About IPv6 Access Lists	19-1
Licensing Requirements for IPv6 Access Lists	19-1
Prerequisites for Adding IPv6 Access Lists	19-2
Guidelines and Limitations	19-2
Default Settings	19-3
Configuring IPv6 Access Lists	19-4
Task Flow for Configuring IPv6 Access Lists	19-4
Adding IPv6 Access Lists	19-5
Adding Remarks to Access Lists	19-6
Monitoring IPv6 Access Lists	19-7
Configuration Examples for IPv6 Access Lists	19-7
Where to Go Next	19-7
Feature History for IPv6 Access Lists	19-7

CHAPTER 20

Configuring Logging for Access Lists 20-1

Configuring Logging for Access Lists	20-1
Information About Logging Access List Activity	20-1
Licensing Requirements for Access List Logging	20-2
Guidelines and Limitations	20-2
Default Settings	20-3
Configuring Access List Logging	20-3
Monitoring Access Lists	20-4
Configuration Examples for Access List Logging	20-4
Feature History for Access List Logging	20-5
Managing Deny Flows	20-5
Information About Managing Deny Flows	20-6
Licensing Requirements for Managing Deny Flows	20-6
Guidelines and Limitations	20-6
Default Settings	20-7

Managing Deny Flows	20-7
Monitoring Deny Flows	20-7
Feature History for Managing Deny Flows	20-8

PART 6

Configuring IP Routing

CHAPTER 21

Routing Overview 21-1

Information About Routing	21-1
Switching	21-2
Path Determination	21-2
Supported Route Types	21-2
Static Versus Dynamic	21-3
Single-Path Versus Multipath	21-3
Flat Versus Hierarchical	21-3
Link-State Versus Distance Vector	21-4
How Routing Behaves Within the ASA	21-4
Egress Interface Selection Process	21-4
Next Hop Selection Process	21-4
Supported Internet Protocols for Routing	21-5
Information About the Routing Table	21-6
Displaying the Routing Table	21-6
How the Routing Table Is Populated	21-6
Backup Routes	21-8
How Forwarding Decisions Are Made	21-8
Dynamic Routing and Failover	21-9
Information About IPv6 Support	21-9
Features That Support IPv6	21-9
IPv6-Enabled Commands	21-10
Entering IPv6 Addresses in Commands	21-11
Disabling Proxy ARPs	21-11

CHAPTER 22

Configuring Static and Default Routes 22-1

Information About Static and Default Routes	22-1
Licensing Requirements for Static and Default Routes	22-2
Guidelines and Limitations	22-2
Configuring Static and Default Routes	22-2
Configuring a Static Route	22-3
Adding or Editing a Static Route	22-3

Configuring a Default Static Route	22-4
Limitations on Configuring a Default Static Route	22-4
Configuring IPv6 Default and Static Routes	22-5
Monitoring a Static or Default Route	22-6
Configuration Examples for Static or Default Routes	22-8
Feature History for Static and Default Routes	22-8

CHAPTER 23

Defining Route Maps 23-1

Information About Route Maps	23-1
Permit and Deny Clauses	23-2
Match and Set Clause Values	23-2
Licensing Requirements for Route Maps	23-3
Guidelines and Limitations	23-3
Defining a Route Map	23-4
Customizing a Route Map	23-4
Defining a Route to Match a Specific Destination Address	23-4
Configuring the Metric Values for a Route Action	23-5
Configuration Example for Route Maps	23-6
Feature History for Route Maps	23-6

CHAPTER 24

Configuring OSPF 24-1

Information About OSPF	24-1
Licensing Requirements for OSPF	24-2
Guidelines and Limitations	24-3
Configuring OSPF	24-3
Customizing OSPF	24-4
Redistributing Routes Into OSPF	24-4
Configuring Route Summarization When Redistributing Routes Into OSPF	24-6
Configuring Route Summarization Between OSPF Areas	24-7
Configuring OSPF Interface Parameters	24-8
Configuring OSPF Area Parameters	24-10
Configuring OSPF NSSA	24-11
Defining Static OSPF Neighbors	24-12
Configuring Route Calculation Timers	24-13
Logging Neighbors Going Up or Down	24-13
Restarting the OSPF Process	24-14
Configuration Example for OSPF	24-14

Monitoring OSPF	24-16
Feature History for OSPF	24-17

CHAPTER 25

Configuring RIP 25-1

Information About RIP	25-1
Routing Update Process	25-2
RIP Routing Metric	25-2
RIP Stability Features	25-2
RIP Timers	25-2
Licensing Requirements for RIP	25-3
Guidelines and Limitations	25-3
Configuring RIP	25-4
Enabling RIP	25-4
Customizing RIP	25-4
Configuring the RIP Version	25-5
Configuring Interfaces for RIP	25-6
Configuring the RIP Send and Receive Version on an Interface	25-6
Configuring Route Summarization	25-7
Filtering Networks in RIP	25-8
Redistributing Routes into the RIP Routing Process	25-8
Enabling RIP Authentication	25-9
Restarting the RIP Process	25-10
Monitoring RIP	25-11
Configuration Example for RIP	25-11
Feature History for RIP	25-11

CHAPTER 26

Configuring Multicast Routing 26-1

Information About Multicast Routing	26-1
Stub Multicast Routing	26-2
PIM Multicast Routing	26-2
Multicast Group Concept	26-2
Multicast Addresses	26-2
Licensing Requirements for Multicast Routing	26-2
Guidelines and Limitations	26-3
Enabling Multicast Routing	26-3
Customizing Multicast Routing	26-4
Configuring Stub Multicast Routing and Forwarding IGMP Messages	26-4
Configuring a Static Multicast Route	26-4

Configuring IGMP Features	26-5
Disabling IGMP on an Interface	26-6
Configuring IGMP Group Membership	26-6
Configuring a Statically Joined IGMP Group	26-6
Controlling Access to Multicast Groups	26-7
Limiting the Number of IGMP States on an Interface	26-7
Modifying the Query Messages to Multicast Groups	26-8
Changing the IGMP Version	26-9
Configuring PIM Features	26-9
Enabling and Disabling PIM on an Interface	26-10
Configuring a Static Rendezvous Point Address	26-10
Configuring the Designated Router Priority	26-11
Configuring and Filtering PIM Register Messages	26-11
Configuring PIM Message Intervals	26-12
Filtering PIM Neighbors	26-12
Configuring a Bidirectional Neighbor Filter	26-13
Configuring a Multicast Boundary	26-14
Configuration Example for Multicast Routing	26-14
Additional References	26-15
Related Documents	26-15
RFCs	26-15
Feature History for Multicast Routing	26-15

CHAPTER 27

Configuring EIGRP	27-1
Information About EIGRP	27-1
Licensing Requirements for EIGRP	27-2
Guidelines and Limitations	27-2
Configuring EIGRP	27-3
Enabling EIGRP	27-3
Enabling EIGRP Stub Routing	27-3
Customizing EIGRP	27-4
Defining a Network for an EIGRP Routing Process	27-5
Configuring Interfaces for EIGRP	27-6
Configuring Passive Interfaces	27-7
Configuring the Summary Aggregate Addresses on Interfaces	27-8
Changing the Interface Delay Value	27-9
Enabling EIGRP Authentication on an Interface	27-9
Defining an EIGRP Neighbor	27-10
Redistributing Routes Into EIGRP	27-11

Filtering Networks in EIGRP	27-12
Customizing the EIGRP Hello Interval and Hold Time	27-13
Disabling Automatic Route Summarization	27-14
Configuring Default Information in EIGRP	27-15
Disabling EIGRP Split Horizon	27-16
Restarting the EIGRP Process	27-17
Monitoring EIGRP	27-17
Configuration Example for EIGRP	27-18
Feature History for EIGRP	27-19

CHAPTER 28

Configuring IPv6 Neighbor Discovery 28-1

Information About IPv6 Neighbor Discovery	28-1
Neighbor Solicitation Messages	28-2
Neighbor Reachable Time	28-3
Router Advertisement Messages	28-3
Static IPv6 Neighbors	28-4
Licensing Requirements for IPv6 Neighbor Discovery	28-4
Guidelines and Limitations	28-4
Default Settings for IPv6 Neighbor Discovery	28-6
Configuring the Neighbor Solicitation Message Interval	28-6
Configuring the Neighbor Reachable Time	28-7
Configuring the Router Advertisement Transmission Interval	28-7
Configuring the Router Lifetime Value	28-8
Configuring Duplicate Address Detection Settings	28-8
Configuring IPv6 Addresses on an Interface	28-9
Suppressing Router Advertisement Messages	28-9
Configuring the IPv6 Prefix	28-10
Configuring a Static IPv6 Neighbor	28-11
Monitoring IPv6 Neighbor Discovery	28-12
Additional References	28-12
Related Documents for IPv6 Prefixes	28-13
RFCs for IPv6 Prefixes and Documentation	28-13
Feature History for IPv6 Neighbor Discovery	28-13

PART 7

Configuring Network Address Translation

CHAPTER 29**Information About NAT 29-1**

Why Use NAT? 29-1

NAT Terminology 29-2

NAT Types 29-3

NAT Types Overview 29-3

Static NAT 29-3

Information About Static NAT 29-3

Information About Static NAT with Port Translation 29-4

Information About One-to-Many Static NAT 29-6

Information About Other Mapping Scenarios (Not Recommended) 29-7

Dynamic NAT 29-8

Information About Dynamic NAT 29-9

Dynamic NAT Disadvantages and Advantages 29-10

Dynamic PAT 29-10

Information About Dynamic PAT 29-10

Dynamic PAT Disadvantages and Advantages 29-11

Identity NAT 29-11

NAT in Routed and Transparent Mode 29-12

NAT in Routed Mode 29-13

NAT in Transparent Mode 29-13

NAT for VPN 29-14

How NAT is Implemented 29-16

Main Differences Between Network Object NAT and Twice NAT 29-16

Information About Network Object NAT 29-17

Information About Twice NAT 29-17

NAT Rule Order 29-20

NAT Interfaces 29-21

Routing NAT Packets 29-21

Mapped Addresses and Routing 29-22

Transparent Mode Routing Requirements for Remote Networks 29-24

Determining the Egress Interface 29-24

DNS and NAT 29-24

Where to Go Next 29-27

CHAPTER 30**Configuring Network Object NAT 30-1**

Information About Network Object NAT 30-1

Licensing Requirements for Network Object NAT 30-2

Prerequisites for Network Object NAT 30-2

Guidelines and Limitations	30-2
Default Settings	30-3
Configuring Network Object NAT	30-3
Configuring Dynamic NAT	30-4
Configuring Dynamic PAT (Hide)	30-6
Configuring Static NAT or Static NAT-with-Port-Translation	30-10
Configuring Identity NAT	30-12
Monitoring Network Object NAT	30-14
Configuration Examples for Network Object NAT	30-15
Providing Access to an Inside Web Server (Static NAT)	30-15
NAT for Inside Hosts (Dynamic NAT) and NAT for an Outside Web Server (Static NAT)	30-16
Inside Load Balancer with Multiple Mapped Addresses (Static NAT, One-to-Many)	30-17
Single Address for FTP, HTTP, and SMTP (Static NAT-with-Port-Translation)	30-18
DNS Server on Mapped Interface, Web Server on Real Interface (Static NAT with DNS Modification)	30-19
DNS Server and Web Server on Mapped Interface, Web Server is Translated (Static NAT with DNS Modification)	30-21
Feature History for Network Object NAT	30-22

CHAPTER 31

Configuring Twice NAT 31-1

Information About Twice NAT	31-1
Licensing Requirements for Twice NAT	31-2
Prerequisites for Twice NAT	31-2
Guidelines and Limitations	31-2
Default Settings	31-3
Configuring Twice NAT	31-3
Configuring Dynamic NAT	31-4
Configuring Dynamic PAT (Hide)	31-8
Configuring Static NAT or Static NAT-with-Port-Translation	31-15
Configuring Identity NAT	31-20
Monitoring Twice NAT	31-24
Configuration Examples for Twice NAT	31-24
Different Translation Depending on the Destination (Dynamic PAT)	31-24
Different Translation Depending on the Destination Address and Port (Dynamic PAT)	31-26
Feature History for Twice NAT	31-28

PART 8

Configuring Service Policies Using the Modular Policy Framework

CHAPTER 32**Configuring a Service Policy Using the Modular Policy Framework 32-1**

Information About Service Policies	32-1
Supported Features for Through Traffic	32-2
Supported Features for Management Traffic	32-2
Feature Directionality	32-2
Feature Matching Within a Service Policy	32-3
Order in Which Multiple Feature Actions are Applied	32-4
Incompatibility of Certain Feature Actions	32-5
Feature Matching for Multiple Service Policies	32-6
Licensing Requirements for Service Policies	32-6
Guidelines and Limitations	32-6
Default Settings	32-8
Default Configuration	32-8
Default Class Maps	32-9
Task Flows for Configuring Service Policies	32-9
Task Flow for Using the Modular Policy Framework	32-9
Task Flow for Configuring Hierarchical Policy Maps for QoS Traffic Shaping	32-11
Identifying Traffic (Layer 3/4 Class Maps)	32-12
Creating a Layer 3/4 Class Map for Through Traffic	32-12
Creating a Layer 3/4 Class Map for Management Traffic	32-15
Defining Actions (Layer 3/4 Policy Map)	32-15
Applying Actions to an Interface (Service Policy)	32-17
Monitoring Modular Policy Framework	32-18
Configuration Examples for Modular Policy Framework	32-18
Applying Inspection and QoS Policing to HTTP Traffic	32-18
Applying Inspection to HTTP Traffic Globally	32-19
Applying Inspection and Connection Limits to HTTP Traffic to Specific Servers	32-20
Applying Inspection to HTTP Traffic with NAT	32-21
Feature History for Service Policies	32-21

CHAPTER 33**Configuring Special Actions for Application Inspections (Inspection Policy Map) 33-1**

Information About Inspection Policy Maps	33-1
Default Inspection Policy Maps	33-2
Defining Actions in an Inspection Policy Map	33-2
Identifying Traffic in an Inspection Class Map	33-5
Where to Go Next	33-7

PART 9

Configuring Access Control

CHAPTER 34

Configuring Access Rules 34-1

Information About Access Rules 34-1

General Information About Rules 34-2

Implicit Permits 34-2

Using Access Rules and EtherType Rules on the Same Interface 34-2

Using Remarks 34-3

Inbound and Outbound Rules 34-3

Using Global Access Rules 34-4

Information About Extended Access Rules 34-5

Access Rules for Returning Traffic 34-5

Allowing Broadcast and Multicast Traffic through the Transparent Firewall Using Access Rules 34-5

Management Access Rules 34-6

Information About EtherType Rules 34-6

Supported EtherTypes 34-6

Access Rules for Returning Traffic 34-6

Allowing MPLS 34-6

Licensing Requirements for Access Rules 34-7

Prerequisites 34-7

Guidelines and Limitations 34-7

Default Settings 34-8

Configuring Access Rules 34-8

Monitoring Access Rules 34-9

Configuration Examples for Permitting or Denying Network Access 34-9

Feature History for Access Rules 34-10

CHAPTER 35

Configuring AAA Servers and the Local Database 35-1

Information About AAA 35-1

Information About Authentication 35-2

Information About Authorization 35-2

Information About Accounting 35-3

Summary of Server Support 35-3

RADIUS Server Support 35-4

Authentication Methods 35-4

Attribute Support 35-4

RADIUS Authorization Functions 35-5

TACACS+ Server Support	35-5
RSA/SDI Server Support	35-5
RSA/SDI Version Support	35-5
Two-step Authentication Process	35-5
RSA/SDI Primary and Replica Servers	35-6
NT Server Support	35-6
Kerberos Server Support	35-6
LDAP Server Support	35-6
Authentication with LDAP	35-6
LDAP Server Types	35-7
HTTP Forms Authentication for Clientless SSL VPN	35-8
Local Database Support, Including as a Fallback Method	35-8
How Fallback Works with Multiple Servers in a Group	35-8
Using Certificates and User Login Credentials	35-9
Using User Login Credentials	35-9
Using Certificates	35-9
Licensing Requirements for AAA Servers	35-10
Guidelines and Limitations	35-10
Configuring AAA	35-10
Task Flow for Configuring AAA	35-11
Configuring AAA Server Groups	35-11
Configuring Authorization with LDAP for VPN	35-16
Configuring LDAP Attribute Maps	35-18
Adding a User Account to the Local Database	35-20
Differentiating User Roles Using AAA	35-24
Using Local Authentication	35-24
Using RADIUS Authentication	35-25
Using LDAP Authentication	35-25
Using TACACS+ Authentication	35-26
Monitoring AAA Servers	35-26
Additional References	35-27
RFCs	35-27
Feature History for AAA Servers	35-27

CHAPTER 36

Configuring the Identity Firewall 36-1

Information About the Identity Firewall	36-1
Overview of the Identity Firewall	36-1
Architecture for Identity Firewall Deployments	36-2
Features of the Identity Firewall	36-3

Deployment Scenarios	36-4
Cut-through Proxy and VPN Authentication	36-7
Licensing for the Identity Firewall	36-8
Guidelines and Limitations	36-8
Prerequisites	36-9
Configuring the Identity Firewall	36-10
Task Flow for Configuring the Identity Firewall	36-10
Configuring the Active Directory Domain	36-11
Configuring Active Directory Agents	36-13
Configuring Identity Options	36-14
Configuring Identity-based Access Rules	36-20
Configuring Cut-through Proxy Authentication	36-22
Configuring VPN Authentication	36-24
Monitoring the Identity Firewall	36-25
Monitoring AD Agents	36-26
Monitoring Groups	36-26
Monitoring Memory Usage for the Identity Firewall	36-26
Monitoring Users for the Identity Firewall	36-27
Feature History for the Identity Firewall	36-28

CHAPTER 37

Configuring Management Access	37-1
Configuring ASA Access for ASDM, Telnet, or SSH	37-1
Licensing Requirements for ASA Access for ASDM, Telnet, or SSH	37-1
Guidelines and Limitations	37-2
Configuring Telnet Access	37-3
Using a Telnet Client	37-4
Configuring SSH Access	37-4
Using an SSH Client	37-5
Configuring HTTPS Access for ASDM	37-6
Configuring CLI Parameters	37-6
Licensing Requirements for CLI Parameters	37-7
Guidelines and Limitations	37-7
Configuring a Login Banner	37-7
Customizing a CLI Prompt	37-8
Changing the Console Timeout	37-9
Configuring ICMP Access	37-10
Information About ICMP Access	37-10
Licensing Requirements for ICMP Access	37-10

Guidelines and Limitations	37-11
Default Settings	37-11
Configuring ICMP Access	37-11
Configuring Management Access Over a VPN Tunnel	37-12
Licensing Requirements for a Management Interface	37-12
Guidelines and Limitations	37-13
Configuring a Management Interface	37-13
Configuring AAA for System Administrators	37-13
Information About AAA for System Administrators	37-14
Information About Management Authentication	37-14
Information About Command Authorization	37-15
Licensing Requirements for AAA for System Administrators	37-17
Prerequisites	37-17
Guidelines and Limitations	37-18
Default Settings	37-18
Configuring Authentication for CLI and ASDM Access	37-19
Configuring Authentication to Access Privileged EXEC Mode (the enable Command)	37-19
Configuring Authentication for the enable Command	37-20
Authenticating Users with the login Command	37-20
Limiting User CLI and ASDM Access with Management Authorization	37-21
Configuring Command Authorization	37-22
Configuring Local Command Authorization	37-24
Viewing Local Command Privilege Levels	37-26
Configuring Commands on the TACACS+ Server	37-27
Configuring TACACS+ Command Authorization	37-29
Configuring Management Access Accounting	37-30
Viewing the Currently Logged-In User	37-31
Recovering from a Lockout	37-32
Feature History for Management Access	37-33

CHAPTER 38

Configuring AAA Rules for Network Access 38-1

AAA Performance	38-1
Licensing Requirements for AAA Rules	38-1
Guidelines and Limitations	38-2
Configuring Authentication for Network Access	38-2
Information About Authentication	38-2
One-Time Authentication	38-2
Applications Required to Receive an Authentication Challenge	38-2
ASA Authentication Prompts	38-3

Static PAT and HTTP	38-4
Configuring Network Access Authentication	38-4
Enabling Secure Authentication of Web Clients	38-6
Authenticating Directly with the ASA	38-7
Authenticating HTTP(S) Connections with a Virtual Server	38-8
Authenticating Telnet Connections with a Virtual Server	38-9
Configuring Authorization for Network Access	38-11
Configuring TACACS+ Authorization	38-11
Configuring RADIUS Authorization	38-14
Configuring a RADIUS Server to Send Downloadable Access Control Lists	38-14
Configuring a RADIUS Server to Download Per-User Access Control List Names	38-18
Configuring Accounting for Network Access	38-19
Using MAC Addresses to Exempt Traffic from Authentication and Authorization	38-20
Feature History for AAA Rules	38-22

CHAPTER 39**Configuring Filtering Services 39-1**

Information About Web Traffic Filtering	39-1
Configuring ActiveX Filtering	39-2
Information About ActiveX Filtering	39-2
Licensing Requirements for ActiveX Filtering	39-2
Guidelines and Limitations for ActiveX Filtering	39-3
Configuring ActiveX Filtering	39-3
Configuration Examples for ActiveX Filtering	39-3
Feature History for ActiveX Filtering	39-4
Configuring Java Applet Filtering	39-4
Information About Java Applet Filtering	39-4
Licensing Requirements for Java Applet Filtering	39-4
Guidelines and Limitations for Java Applet Filtering	39-5
Configuring Java Applet Filtering	39-5
Configuration Examples for Java Applet Filtering	39-5
Feature History for Java Applet Filtering	39-6
Filtering URLs and FTP Requests with an External Server	39-6
Information About URL Filtering	39-6
Licensing Requirements for URL Filtering	39-7
Guidelines and Limitations for URL Filtering	39-7
Identifying the Filtering Server	39-8
Configuring Additional URL Filtering Settings	39-10
Buffering the Content Server Response	39-10
Caching Server Addresses	39-11

Filtering HTTP URLs	39-11
Filtering HTTPS URLs	39-13
Filtering FTP Requests	39-14
Monitoring Filtering Statistics	39-15
Feature History for URL Filtering	39-17

CHAPTER 40
Configuring Web Cache Services Using WCCP 40-1

Information About WCCP	40-1
Guidelines and Limitations	40-1
Licensing Requirements for WCCP	40-2
Enabling WCCP Redirection	40-3
WCCP Monitoring Commands	40-4
Feature History for WCCP	40-4

CHAPTER 41
Configuring Digital Certificates 41-1

Information About Digital Certificates	41-1
Public Key Cryptography	41-2
Certificate Scalability	41-2
Key Pairs	41-2
Trustpoints	41-3
Certificate Enrollment	41-3
Proxy for SCEP Requests	41-3
Revocation Checking	41-4
Supported CA Servers	41-4
CRLs	41-4
OCSP	41-5
The Local CA	41-6
Storage for Local CA Files	41-6
The Local CA Server	41-6
Licensing Requirements for Digital Certificates	41-7
Prerequisites for Local Certificates	41-7
Prerequisites for SCEP Proxy Support	41-7
Guidelines and Limitations	41-8
Configuring Digital Certificates	41-8
Configuring Key Pairs	41-9
Removing Key Pairs	41-10
Configuring Trustpoints	41-10
Configuring CRLs for a Trustpoint	41-13

Exporting a Trustpoint Configuration	41-15
Importing a Trustpoint Configuration	41-15
Configuring CA Certificate Map Rules	41-16
Obtaining Certificates Manually	41-18
Obtaining Certificates Automatically with SCEP	41-20
Configuring Proxy Support for SCEP Requests	41-21
Enabling the Local CA Server	41-22
Configuring the Local CA Server	41-23
Customizing the Local CA Server	41-25
Debugging the Local CA Server	41-26
Disabling the Local CA Server	41-26
Deleting the Local CA Server	41-26
Configuring Local CA Certificate Characteristics	41-27
Configuring the Issuer Name	41-28
Configuring the CA Certificate Lifetime	41-28
Configuring the User Certificate Lifetime	41-29
Configuring the CRL Lifetime	41-30
Configuring the Server Keysize	41-30
Setting Up External Local CA File Storage	41-31
Downloading CRLs	41-33
Storing CRLs	41-34
Setting Up Enrollment Parameters	41-35
Adding and Enrolling Users	41-36
Renewing Users	41-38
Restoring Users	41-39
Removing Users	41-39
Revoking Certificates	41-40
Maintaining the Local CA Certificate Database	41-40
Rolling Over Local CA Certificates	41-40
Archiving the Local CA Server Certificate and Keypair	41-41
Monitoring Digital Certificates	41-41
Feature History for Certificate Management	41-43

PART 10**Configuring Application Inspection****CHAPTER 42****Getting Started with Application Layer Protocol Inspection 42-1**

Information about Application Layer Protocol Inspection	42-1
How Inspection Engines Work	42-1
When to Use Application Protocol Inspection	42-2

Guidelines and Limitations	42-3
Default Settings	42-4
Configuring Application Layer Protocol Inspection	42-6

CHAPTER 43

Configuring Inspection of Basic Internet Protocols 43-1

DNS Inspection	43-1
How DNS Application Inspection Works	43-2
How DNS Rewrite Works	43-2
Configuring DNS Rewrite	43-3
Configuring DNS Rewrite with Two NAT Zones	43-4
Overview of DNS Rewrite with Three NAT Zones	43-4
Configuring DNS Rewrite with Three NAT Zones	43-6
Configuring a DNS Inspection Policy Map for Additional Inspection Control	43-7
Verifying and Monitoring DNS Inspection	43-10
FTP Inspection	43-11
FTP Inspection Overview	43-11
Using the strict Option	43-11
Configuring an FTP Inspection Policy Map for Additional Inspection Control	43-12
Verifying and Monitoring FTP Inspection	43-16
HTTP Inspection	43-16
HTTP Inspection Overview	43-16
Configuring an HTTP Inspection Policy Map for Additional Inspection Control	43-17
ICMP Inspection	43-20
ICMP Error Inspection	43-21
Instant Messaging Inspection	43-21
IM Inspection Overview	43-21
Configuring an Instant Messaging Inspection Policy Map for Additional Inspection Control	43-21
IP Options Inspection	43-24
IP Options Inspection Overview	43-25
Configuring an IP Options Inspection Policy Map for Additional Inspection Control	43-25
IPsec Pass Through Inspection	43-26
IPsec Pass Through Inspection Overview	43-27
Example for Defining an IPsec Pass Through Parameter Map	43-27
IPv6 Inspection	43-27
Configuring an IPv6 Inspection Policy Map	43-28
NetBIOS Inspection	43-28
NetBIOS Inspection Overview	43-28
Configuring a NetBIOS Inspection Policy Map for Additional Inspection Control	43-29

PPTP Inspection	43-30
SMTP and Extended SMTP Inspection	43-31
SMTP and ESMTP Inspection Overview	43-31
Configuring an ESMTP Inspection Policy Map for Additional Inspection Control	43-32
TFTP Inspection	43-34

CHAPTER 44
Configuring Inspection for Voice and Video Protocols 44-1

CTIQBE Inspection	44-1
CTIQBE Inspection Overview	44-1
Limitations and Restrictions	44-2
Verifying and Monitoring CTIQBE Inspection	44-2
H.323 Inspection	44-3
H.323 Inspection Overview	44-4
How H.323 Works	44-4
H.239 Support in H.245 Messages	44-5
Limitations and Restrictions	44-5
Configuring an H.323 Inspection Policy Map for Additional Inspection Control	44-6
Configuring H.323 and H.225 Timeout Values	44-9
Verifying and Monitoring H.323 Inspection	44-9
Monitoring H.225 Sessions	44-9
Monitoring H.245 Sessions	44-10
Monitoring H.323 RAS Sessions	44-10
MGCP Inspection	44-11
MGCP Inspection Overview	44-11
Configuring an MGCP Inspection Policy Map for Additional Inspection Control	44-13
Configuring MGCP Timeout Values	44-14
Verifying and Monitoring MGCP Inspection	44-14
RTSP Inspection	44-15
RTSP Inspection Overview	44-15
Using RealPlayer	44-16
Restrictions and Limitations	44-16
Configuring an RTSP Inspection Policy Map for Additional Inspection Control	44-16
SIP Inspection	44-19
SIP Inspection Overview	44-19
SIP Instant Messaging	44-19
Configuring a SIP Inspection Policy Map for Additional Inspection Control	44-20
Configuring SIP Timeout Values	44-24
Verifying and Monitoring SIP Inspection	44-24
Skinny (SCCP) Inspection	44-25

SCCP Inspection Overview	44-25
Supporting Cisco IP Phones	44-26
Restrictions and Limitations	44-26
Configuring a Skinny (SCCP) Inspection Policy Map for Additional Inspection Control	44-26
Verifying and Monitoring SCCP Inspection	44-28

CHAPTER 45**Configuring Inspection of Database and Directory Protocols 45-1**

ILS Inspection	45-1
SQL *Net Inspection	45-2
Sun RPC Inspection	45-3
Sun RPC Inspection Overview	45-3
Managing Sun RPC Services	45-4
Verifying and Monitoring Sun RPC Inspection	45-4

CHAPTER 46**Configuring Inspection for Management Application Protocols 46-1**

DCERPC Inspection	46-1
DCERPC Overview	46-1
Configuring a DCERPC Inspection Policy Map for Additional Inspection Control	46-2
GTP Inspection	46-3
GTP Inspection Overview	46-3
Configuring a GTP Inspection Policy Map for Additional Inspection Control	46-4
Verifying and Monitoring GTP Inspection	46-8
RADIUS Accounting Inspection	46-9
RADIUS Accounting Inspection Overview	46-9
Configuring a RADIUS Inspection Policy Map for Additional Inspection Control	46-10
RSH Inspection	46-11
SNMP Inspection	46-11
SNMP Inspection Overview	46-11
Configuring an SNMP Inspection Policy Map for Additional Inspection Control	46-11
XDMCP Inspection	46-12

PART 11**Configuring Unified Communications****CHAPTER 47****Information About Cisco Unified Communications Proxy Features 47-1**

Information About the Adaptive Security Appliance in Cisco Unified Communications	47-1
TLS Proxy Applications in Cisco Unified Communications	47-3
Licensing for Cisco Unified Communications Proxy Features	47-4

CHAPTER 48**Configuring the Cisco Phone Proxy 48-1**

Information About the Cisco Phone Proxy	48-1
Phone Proxy Functionality	48-1
Supported Cisco UCM and IP Phones for the Phone Proxy	48-3
Licensing Requirements for the Phone Proxy	48-4
Prerequisites for the Phone Proxy	48-5
Media Termination Instance Prerequisites	48-6
Certificates from the Cisco UCM	48-6
DNS Lookup Prerequisites	48-7
Cisco Unified Communications Manager Prerequisites	48-7
Access List Rules	48-7
NAT and PAT Prerequisites	48-8
Prerequisites for IP Phones on Multiple Interfaces	48-8
7960 and 7940 IP Phones Support	48-9
Cisco IP Communicator Prerequisites	48-10
Prerequisites for Rate Limiting TFTP Requests	48-10
Rate Limiting Configuration Example	48-11
About ICMP Traffic Destined for the Media Termination Address	48-11
End-User Phone Provisioning	48-11
Ways to Deploy IP Phones to End Users	48-12
Phone Proxy Guidelines and Limitations	48-12
General Guidelines and Limitations	48-12
Media Termination Address Guidelines and Limitations	48-14
Configuring the Phone Proxy	48-14
Task Flow for Configuring the Phone Proxy in a Non-secure Cisco UCM Cluster	48-15
Importing Certificates from the Cisco UCM	48-15
Task Flow for Configuring the Phone Proxy in a Mixed-mode Cisco UCM Cluster	48-17
Creating Trustpoints and Generating Certificates	48-17
Creating the CTL File	48-18
Using an Existing CTL File	48-20
Creating the TLS Proxy Instance for a Non-secure Cisco UCM Cluster	48-20
Creating the TLS Proxy for a Mixed-mode Cisco UCM Cluster	48-21
Creating the Media Termination Instance	48-22
Creating the Phone Proxy Instance	48-23
Enabling the Phone Proxy with SIP and Skinny Inspection	48-25
Configuring Linksys Routers with UDP Port Forwarding for the Phone Proxy	48-26
Configuring Your Router	48-27
Troubleshooting the Phone Proxy	48-27
Debugging Information from the Security Appliance	48-27

Debugging Information from IP Phones	48-31
IP Phone Registration Failure	48-32
TFTP Auth Error Displays on IP Phone Console	48-32
Configuration File Parsing Error	48-33
Configuration File Parsing Error: Unable to Get DNS Response	48-33
Non-configuration File Parsing Error	48-34
Cisco UCM Does Not Respond to TFTP Request for Configuration File	48-34
IP Phone Does Not Respond After the Security Appliance Sends TFTP Data	48-35
IP Phone Requesting Unsigned File Error	48-36
IP Phone Unable to Download CTL File	48-36
IP Phone Registration Failure from Signaling Connections	48-37
SSL Handshake Failure	48-39
Certificate Validation Errors	48-40
Media Termination Address Errors	48-40
Audio Problems with IP Phones	48-41
Saving SAST Keys	48-42
Configuration Examples for the Phone Proxy	48-43
Example 1: Nonsecure Cisco UCM cluster, Cisco UCM and TFTP Server on Publisher	48-43
Example 2: Mixed-mode Cisco UCM cluster, Cisco UCM and TFTP Server on Publisher	48-45
Example 3: Mixed-mode Cisco UCM cluster, Cisco UCM and TFTP Server on Different Servers	48-46
Example 4: Mixed-mode Cisco UCM cluster, Primary Cisco UCM, Secondary and TFTP Server on Different Servers	48-47
Example 5: LSC Provisioning in Mixed-mode Cisco UCM cluster; Cisco UCM and TFTP Server on Publisher	48-49
Example 6: VLAN Transversal	48-51
Feature History for the Phone Proxy	48-53

CHAPTER 49

Configuring the TLS Proxy for Encrypted Voice Inspection 49-1

Information about the TLS Proxy for Encrypted Voice Inspection	49-1
Decryption and Inspection of Unified Communications Encrypted Signaling	49-2
CTL Client Overview	49-3
Licensing for the TLS Proxy	49-5
Prerequisites for the TLS Proxy for Encrypted Voice Inspection	49-7
Configuring the TLS Proxy for Encrypted Voice Inspection	49-7
Task flow for Configuring the TLS Proxy for Encrypted Voice Inspection	49-7
Creating Trustpoints and Generating Certificates	49-8
Creating an Internal CA	49-10
Creating a CTL Provider Instance	49-11
Creating the TLS Proxy Instance	49-12

Enabling the TLS Proxy Instance for Skinny or SIP Inspection	49-13
Monitoring the TLS Proxy	49-14
Feature History for the TLS Proxy for Encrypted Voice Inspection	49-16

CHAPTER 50**Configuring Cisco Mobility Advantage 50-1**

Information about the Cisco Mobility Advantage Proxy Feature	50-1
Cisco Mobility Advantage Proxy Functionality	50-1
Mobility Advantage Proxy Deployment Scenarios	50-2
Mobility Advantage Proxy Using NAT/PAT	50-4
Trust Relationships for Cisco UMA Deployments	50-5
Licensing for the Cisco Mobility Advantage Proxy Feature	50-6
Configuring Cisco Mobility Advantage	50-6
Task Flow for Configuring Cisco Mobility Advantage	50-7
Installing the Cisco UMA Server Certificate	50-7
Creating the TLS Proxy Instance	50-8
Enabling the TLS Proxy for MMP Inspection	50-9
Monitoring for Cisco Mobility Advantage	50-10
Configuration Examples for Cisco Mobility Advantage	50-11
Example 1: Cisco UMC/Cisco UMA Architecture – Security Appliance as Firewall with TLS Proxy and MMP Inspection	50-11
Example 2: Cisco UMC/Cisco UMA Architecture – Security Appliance as TLS Proxy Only	50-12
Feature History for Cisco Mobility Advantage	50-14

CHAPTER 51**Configuring Cisco Unified Presence 51-1**

Information About Cisco Unified Presence	51-1
Architecture for Cisco Unified Presence for SIP Federation Deployments	51-1
Trust Relationship in the Presence Federation	51-4
Security Certificate Exchange Between Cisco UP and the Security Appliance	51-5
XMPP Federation Deployments	51-5
Configuration Requirements for XMPP Federation	51-6
Licensing for Cisco Unified Presence	51-7
Configuring Cisco Unified Presence Proxy for SIP Federation	51-8
Task Flow for Configuring Cisco Unified Presence Federation Proxy for SIP Federation	51-8
Creating Trustpoints and Generating Certificates	51-9
Installing Certificates	51-10
Creating the TLS Proxy Instance	51-12
Enabling the TLS Proxy for SIP Inspection	51-13
Monitoring Cisco Unified Presence	51-14

Configuration Example for Cisco Unified Presence	51-14
Example Configuration for SIP Federation Deployments	51-15
Example Access List Configuration for XMPP Federation	51-17
Example NAT Configuration for XMPP Federation	51-18
Feature History for Cisco Unified Presence	51-20

CHAPTER 52
Configuring Cisco Intercompany Media Engine Proxy 52-1

Information About Cisco Intercompany Media Engine Proxy	52-1
Features of Cisco Intercompany Media Engine Proxy	52-1
How the UC-IME Works with the PSTN and the Internet	52-2
Tickets and Passwords	52-3
Call Fallback to the PSTN	52-5
Architecture and Deployment Scenarios for Cisco Intercompany Media Engine	52-5
Architecture	52-5
Basic Deployment	52-6
Off Path Deployment	52-7
Licensing for Cisco Intercompany Media Engine	52-8
Guidelines and Limitations	52-9
Configuring Cisco Intercompany Media Engine Proxy	52-11
Task Flow for Configuring Cisco Intercompany Media Engine	52-11
Configuring NAT for Cisco Intercompany Media Engine Proxy	52-12
Configuring PAT for the Cisco UCM Server	52-14
Creating Access Lists for Cisco Intercompany Media Engine Proxy	52-16
Creating the Media Termination Instance	52-17
Creating the Cisco Intercompany Media Engine Proxy	52-18
Creating Trustpoints and Generating Certificates	52-21
Creating the TLS Proxy	52-24
Enabling SIP Inspection for the Cisco Intercompany Media Engine Proxy	52-25
(Optional) Configuring TLS within the Local Enterprise	52-27
(Optional) Configuring Off Path Signaling	52-30
Configuring the Cisco UC-IMC Proxy by using the UC-IME Proxy Pane	52-31
Configuring the Cisco UC-IMC Proxy by using the Unified Communications Wizard	52-33
Troubleshooting Cisco Intercompany Media Engine Proxy	52-34
Feature History for Cisco Intercompany Media Engine Proxy	52-37

PART 12
Configuring Connection Settings and QoS

CHAPTER 53**Configuring Connection Settings 53-1**

- Information About Connection Settings 53-1
 - TCP Intercept and Limiting Embryonic Connections 53-2
 - Disabling TCP Intercept for Management Packets for Clientless SSL Compatibility 53-2
 - Dead Connection Detection (DCD) 53-2
 - TCP Sequence Randomization 53-3
 - TCP Normalization 53-3
 - TCP State Bypass 53-3
- Licensing Requirements for Connection Settings 53-4
- Guidelines and Limitations 53-5
 - TCP State Bypass Guidelines and Limitations 53-5
- Default Settings 53-5
- Configuring Connection Settings 53-6
 - Task Flow For Configuring Configuration Settings (Except Global Timeouts) 53-6
 - Customizing the TCP Normalizer with a TCP Map 53-6
 - Configuring Connection Settings 53-10
- Monitoring Connection Settings 53-14
 - Monitoring TCP State Bypass 53-14
- Configuration Examples for Connection Settings 53-14
 - Configuration Examples for Connection Limits and Timeouts 53-15
 - Configuration Examples for TCP State Bypass 53-15
 - Configuration Examples for TCP Normalization 53-15
- Feature History for Connection Settings 53-16

CHAPTER 54**Configuring QoS 54-1**

- Information About QoS 54-1
 - Supported QoS Features 54-2
 - What is a Token Bucket? 54-2
 - Information About Policing 54-3
 - Information About Priority Queuing 54-3
 - Information About Traffic Shaping 54-4
 - How QoS Features Interact 54-4
 - DSCP and DiffServ Preservation 54-5
- Licensing Requirements for QoS 54-5
- Guidelines and Limitations 54-5
- Configuring QoS 54-6
 - Determining the Queue and TX Ring Limits for a Standard Priority Queue 54-6
 - Configuring the Standard Priority Queue for an Interface 54-7

Configuring a Service Rule for Standard Priority Queuing and Policing	54-9
Configuring a Service Rule for Traffic Shaping and Hierarchical Priority Queuing	54-12
(Optional) Configuring the Hierarchical Priority Queuing Policy	54-12
Configuring the Service Rule	54-13
Monitoring QoS	54-15
Viewing QoS Police Statistics	54-15
Viewing QoS Standard Priority Statistics	54-16
Viewing QoS Shaping Statistics	54-16
Viewing QoS Standard Priority Queue Statistics	54-17
Feature History for QoS	54-18

PART 13**Configuring Advanced Network Protection****CHAPTER 55****Configuring the Botnet Traffic Filter 55-1**

Information About the Botnet Traffic Filter	55-1
Botnet Traffic Filter Address Categories	55-2
Botnet Traffic Filter Actions for Known Addresses	55-2
Botnet Traffic Filter Databases	55-2
Information About the Dynamic Database	55-2
Information About the Static Database	55-3
Information About the DNS Reverse Lookup Cache and DNS Host Cache	55-3
How the Botnet Traffic Filter Works	55-4
Licensing Requirements for the Botnet Traffic Filter	55-5
Guidelines and Limitations	55-5
Default Settings	55-6
Configuring the Botnet Traffic Filter	55-6
Task Flow for Configuring the Botnet Traffic Filter	55-6
Configuring the Dynamic Database	55-7
Adding Entries to the Static Database	55-8
Enabling DNS Snooping	55-9
Enabling Traffic Classification and Actions for the Botnet Traffic Filter	55-11
Blocking Botnet Traffic Manually	55-14
Searching the Dynamic Database	55-15
Monitoring the Botnet Traffic Filter	55-16
Botnet Traffic Filter Syslog Messaging	55-16
Botnet Traffic Filter Commands	55-16
Configuration Examples for the Botnet Traffic Filter	55-18
Recommended Configuration Example	55-18

Other Configuration Examples	55-19
Where to Go Next	55-20
Feature History for the Botnet Traffic Filter	55-21

CHAPTER 56**Configuring Threat Detection 56-1**

Information About Threat Detection	56-1
Licensing Requirements for Threat Detection	56-1
Configuring Basic Threat Detection Statistics	56-2
Information About Basic Threat Detection Statistics	56-2
Guidelines and Limitations	56-3
Default Settings	56-3
Configuring Basic Threat Detection Statistics	56-4
Monitoring Basic Threat Detection Statistics	56-5
Feature History for Basic Threat Detection Statistics	56-6
Configuring Advanced Threat Detection Statistics	56-6
Information About Advanced Threat Detection Statistics	56-6
Guidelines and Limitations	56-6
Default Settings	56-7
Configuring Advanced Threat Detection Statistics	56-7
Monitoring Advanced Threat Detection Statistics	56-9
Feature History for Advanced Threat Detection Statistics	56-14
Configuring Scanning Threat Detection	56-15
Information About Scanning Threat Detection	56-15
Guidelines and Limitations	56-16
Default Settings	56-16
Configuring Scanning Threat Detection	56-17
Monitoring Shunned Hosts, Attackers, and Targets	56-17
Feature History for Scanning Threat Detection	56-18
Configuration Examples for Threat Detection	56-19

CHAPTER 57**Using Protection Tools 57-1**

Preventing IP Spoofing	57-1
Configuring the Fragment Size	57-2
Blocking Unwanted Connections	57-2
Configuring IP Audit for Basic IPS Support	57-3
Configuring IP Audit	57-3
IP Audit Signature List	57-4

PART 14**Configuring Modules****CHAPTER 58****Configuring the IPS Module 58-1**

- Information About the IPS Module 58-1
 - How the IPS Module Works with the ASA 58-1
 - Operating Modes 58-2
 - Using Virtual Sensors (ASA 5510 and Higher) 58-3
 - Information About Management Access 58-4
- Licensing Requirements for the IPS Module 58-4
- Guidelines and Limitations 58-5
- Default Settings 58-5
- Configuring the IPS Module 58-6
 - Task Flow for the IPS Module 58-6
 - Configuring Management Access 58-7
 - Connecting Management Interface Cables 58-7
 - Configuring the IPS Module Management Interface (ASA 5505) 58-8
 - Sessioning to the Module from the ASA 58-11
 - Configuring the Security Policy on the IPS Module 58-11
 - Assigning Virtual Sensors to a Security Context (ASA 5510 and Higher) 58-12
 - Diverting Traffic to the IPS Module 58-14
- Monitoring the IPS Module 58-16
- Troubleshooting the IPS Module 58-18
 - Installing an Image on the Module 58-18
 - Password Troubleshooting 58-19
 - Reloading or Resetting the Module 58-20
 - Shutting Down the Module 58-20
- Configuration Examples for the IPS Module 58-20
- Feature History for the IPS Module 58-21

CHAPTER 59**Configuring the Content Security and Control Application on the CSC SSM 59-1**

- Information About the CSC SSM 59-1
 - Determining What Traffic to Scan 59-3
- Licensing Requirements for the CSC SSM 59-5
- Prerequisites for the CSC SSM 59-5
- Guidelines and Limitations 59-6
- Default Settings 59-7
- Configuring the CSC SSM 59-7
 - Before Configuring the CSC SSM 59-7

Connecting to the CSC SSM	59-9
Diverting Traffic to the CSC SSM	59-10
Monitoring the CSC SSM	59-13
Troubleshooting the CSC Module	59-14
Installing an Image on the Module	59-14
Password Troubleshooting	59-15
Reloading or Resetting the Module	59-16
Shutting Down the Module	59-16
Configuration Examples for the CSC SSM	59-17
Where to Go Next	59-18
Additional References	59-18
Feature History for the CSC SSM	59-18

PART 15

Configuring High Availability

CHAPTER 60

Information About High Availability	60-1
Introduction to Failover and High Availability	60-1
Failover System Requirements	60-2
Hardware Requirements	60-2
Software Requirements	60-2
License Requirements	60-2
Failover and Stateful Failover Links	60-3
Failover Link	60-3
Stateful Failover Link	60-4
Failover Interface Speed for Stateful Links	60-5
Avoiding Interrupted Failover Links	60-5
Active/Active and Active/Standby Failover	60-9
Determining Which Type of Failover to Use	60-9
Stateless (Regular) and Stateful Failover	60-10
Stateless (Regular) Failover	60-10
Stateful Failover	60-10
Transparent Firewall Mode Requirements	60-12
Auto Update Server Support in Failover Configurations	60-12
Auto Update Process Overview	60-13
Monitoring the Auto Update Process	60-14
Failover Health Monitoring	60-15
Unit Health Monitoring	60-15
Interface Monitoring	60-15

Failover Times	60-16
Failover Messages	60-17
Failover System Messages	60-17
Debug Messages	60-17
SNMP	60-17

CHAPTER 61

Configuring Active/Standby Failover 61-1

Information About Active/Standby Failover	61-1
Active/Standby Failover Overview	61-1
Primary/Secondary Status and Active/Standby Status	61-2
Device Initialization and Configuration Synchronization	61-2
Command Replication	61-3
Failover Triggers	61-4
Failover Actions	61-4
Optional Active/Standby Failover Settings	61-6
Licensing Requirements for Active/Standby Failover	61-6
Prerequisites for Active/Standby Failover	61-6
Guidelines and Limitations	61-6
Configuring Active/Standby Failover	61-7
Task Flow for Configuring Active/Standby Failover	61-7
Configuring the Primary Unit	61-8
Configuring the Secondary Unit	61-10
Configuring Optional Active/Standby Failover Settings	61-12
Enabling HTTP Replication with Stateful Failover	61-12
Disabling and Enabling Interface Monitoring	61-12
Configuring Failover Criteria	61-13
Configuring the Unit and Interface Health Poll Times	61-13
Configuring Virtual MAC Addresses	61-14
Controlling Failover	61-15
Forcing Failover	61-15
Disabling Failover	61-16
Restoring a Failed Unit	61-16
Testing the Failover Functionality	61-16
Monitoring Active/Standby Failover	61-17
Feature History for Active/Standby Failover	61-17

CHAPTER 62

Configuring Active/Active Failover 62-1

Information About Active/Active Failover	62-1
--	------

Active/Active Failover Overview	62-1
Primary/Secondary Status and Active/Standby Status	62-2
Device Initialization and Configuration Synchronization	62-3
Command Replication	62-3
Failover Triggers	62-4
Failover Actions	62-5
Optional Active/Active Failover Settings	62-6
Licensing Requirements for Active/Active Failover	62-6
Prerequisites for Active/Active Failover	62-7
Guidelines and Limitations	62-7
Configuring Active/Active Failover	62-8
Task Flow for Configuring Active/Active Failover	62-8
Configuring the Primary Failover Unit	62-8
Configuring the Secondary Failover Unit	62-11
Configuring Optional Active/Active Failover Settings	62-12
Configuring Failover Group Preemption	62-12
Enabling HTTP Replication with Stateful Failover	62-14
Disabling and Enabling Interface Monitoring	62-14
Configuring Interface Health Monitoring	62-15
Configuring Failover Criteria	62-16
Configuring Virtual MAC Addresses	62-16
Configuring Support for Asymmetrically Routed Packets	62-18
Remote Command Execution	62-21
Changing Command Modes	62-22
Security Considerations	62-23
Limitations of Remote Command Execution	62-23
Controlling Failover	62-23
Forcing Failover	62-23
Disabling Failover	62-24
Restoring a Failed Unit or Failover Group	62-24
Testing the Failover Functionality	62-24
Monitoring Active/Active Failover	62-25
Feature History for Active/Active Failover	62-25

PART 16

Configuring VPN

CHAPTER 63

Configuring IPsec and ISAKMP 63-1

Information About Tunneling, IPsec, and ISAKMP	63-1
--	------

IPsec Overview	63-2
ISAKMP and IKE Overview	63-2
Licensing Requirements for Remote Access IPsec VPNs	63-3
Guidelines and Limitations	63-6
Configuring ISAKMP	63-6
Configuring IKEv1 and IKEv2 Policies	63-8
Enabling IKE on the Outside Interface	63-12
Disabling IKEv1 Aggressive Mode	63-12
Determining an ID Method for IKEv1 and IKEv2 ISAKMP Peers	63-12
Enabling IPsec over NAT-T	63-13
Using NAT-T	63-14
Enabling IPsec with IKEv1 over TCP	63-14
Waiting for Active Sessions to Terminate Before Rebooting	63-15
Alerting Peers Before Disconnecting	63-15
Configuring Certificate Group Matching for IKEv1	63-16
Creating a Certificate Group Matching Rule and Policy	63-16
Using the Tunnel-group-map default-group Command	63-18
Configuring IPsec	63-18
Understanding IPsec Tunnels	63-18
Understanding IKEv1 Transform Sets and IKEv2 Proposals	63-18
Defining Crypto Maps	63-19
Applying Crypto Maps to Interfaces	63-25
Using Interface Access Lists	63-25
Changing IPsec SA Lifetimes	63-28
Creating a Basic IPsec Configuration	63-28
Using Dynamic Crypto Maps	63-30
Providing Site-to-Site Redundancy	63-33
Viewing an IPsec Configuration	63-33
Clearing Security Associations	63-33
Clearing Crypto Map Configurations	63-34
Supporting the Nokia VPN Client	63-34

CHAPTER 64

Configuring L2TP over IPsec 64-1

Information About L2TP over IPsec/IKEv1	64-1
IPsec Transport and Tunnel Modes	64-2
Licensing Requirements for L2TP over IPsec	64-3
Prerequisites for Configuring L2TP over IPsec	64-6
Guidelines and Limitations	64-6

Configuring L2TP over IPsec	64-7
Configuration Example for L2TP over IPsec Using ASA 8.2.5	64-16
Configuration Example for L2TP over IPsec Using ASA 8.4.1 and later	64-16
Feature History for L2TP over IPsec	64-17

CHAPTER 65
Setting General VPN Parameters 65-1

Configuring VPNs in Single, Routed Mode	65-1
Configuring IPsec to Bypass ACLs	65-1
Permitting Intra-Interface Traffic (Hairpinning)	65-2
NAT Considerations for Intra-Interface Traffic	65-3
Setting Maximum Active IPsec or SSL VPN Sessions	65-3
Using Client Update to Ensure Acceptable IPsec Client Revision Levels	65-4
Understanding Load Balancing	65-6
Comparing Load Balancing to Failover	65-7
Load Balancing	65-7
Failover	65-7
Implementing Load Balancing	65-7
Prerequisites	65-8
Eligible Platforms	65-8
Eligible Clients	65-8
VPN Load-Balancing Algorithm	65-8
VPN Load-Balancing Cluster Configurations	65-9
Some Typical Mixed Cluster Scenarios	65-10
Scenario 1: Mixed Cluster with No SSL VPN Connections	65-10
Scenario 2: Mixed Cluster Handling SSL VPN Connections	65-10

Configuring Load Balancing 65-11

Configuring the Public and Private Interfaces for Load Balancing	65-11
Configuring the Load Balancing Cluster Attributes	65-12
Enabling Redirection Using a Fully Qualified Domain Name	65-13
Frequently Asked Questions About Load Balancing	65-14
IP Address Pool Exhaustion	65-14
Unique IP Address Pools	65-14
Using Load Balancing and Failover on the Same Device	65-15
Load Balancing on Multiple Interfaces	65-15
Maximum Simultaneous Sessions for Load Balancing Clusters	65-15
Viewing Load Balancing	65-15
Configuring VPN Session Limits	65-16

CHAPTER 66**Configuring Connection Profiles, Group Policies, and Users 66-1**

Overview of Connection Profiles, Group Policies, and Users 66-1

Connection Profiles 66-2

General Connection Profile Connection Parameters 66-3

IPsec Tunnel-Group Connection Parameters 66-4

Connection Profile Connection Parameters for SSL VPN Sessions 66-5

Configuring Connection Profiles 66-6

Maximum Connection Profiles 66-6

Default IPsec Remote Access Connection Profile Configuration 66-7

Configuring IPsec Tunnel-Group General Attributes 66-7

Configuring Remote-Access Connection Profiles 66-7

Specifying a Name and Type for the Remote Access Connection Profile 66-8

Configuring Remote-Access Connection Profile General Attributes 66-8

Configuring Double Authentication 66-12

Configuring Remote-Access Connection Profile IPsec IKEv1 Attributes 66-13

Configuring IPsec Remote-Access Connection Profile PPP Attributes 66-15

Configuring LAN-to-LAN Connection Profiles 66-17

Default LAN-to-LAN Connection Profile Configuration 66-17

Specifying a Name and Type for a LAN-to-LAN Connection Profile 66-17

Configuring LAN-to-LAN Connection Profile General Attributes 66-17

Configuring LAN-to-LAN IPsec IKEv1 Attributes 66-18

Configuring Connection Profiles for Clientless SSL VPN Sessions 66-20

Configuring General Tunnel-Group Attributes for Clientless SSL VPN Sessions 66-20

Configuring Tunnel-Group Attributes for Clientless SSL VPN Sessions 66-23

Customizing Login Windows for Users of Clientless SSL VPN sessions 66-27

Configuring Microsoft Active Directory Settings for Password Management 66-28

Using Active Directory to Force the User to Change Password at Next Logon 66-29

Using Active Directory to Specify Maximum Password Age 66-30

Using Active Directory to Override an Account Disabled AAA Indicator 66-31

Using Active Directory to Enforce Minimum Password Length 66-32

Using Active Directory to Enforce Password Complexity 66-33

Configuring the Connection Profile for RADIUS/SDI Message Support for the AnyConnect Client 66-34

AnyConnect Client and RADIUS/SDI Server Interaction 66-34

Configuring the Security Appliance to Support RADIUS/SDI Messages 66-35

Group Policies 66-36

Default Group Policy 66-37

Configuring Group Policies 66-39

Configuring an External Group Policy 66-39

Configuring an Internal Group Policy	66-40
Configuring Group Policy Attributes	66-40
Configuring WINS and DNS Servers	66-40
Configuring VPN-Specific Attributes	66-42
Configuring Security Attributes	66-46
Configuring the Banner Message	66-48
Configuring IPsec-UDP Attributes for IKEv1	66-49
Configuring Split-Tunneling Attributes	66-49
Configuring Domain Attributes for Tunneling	66-51
Configuring Attributes for VPN Hardware Clients	66-53
Configuring Backup Server Attributes	66-56
Configuring Microsoft Internet Explorer Client Parameters	66-57
Configuring Network Admission Control Parameters	66-59
Configuring Address Pools	66-62
Configuring Firewall Policies	66-63
Supporting a Zone Labs Integrity Server	66-64
Overview of the Integrity Server and ASA Interaction	66-64
Configuring Integrity Server Support	66-65
Setting Client Firewall Parameters	66-66
Configuring Client Access Rules	66-68
Configuring Group-Policy Attributes for Clientless SSL VPN Sessions	66-70
Configuring Group-Policy Attributes for AnyConnect Secure Mobility Client Connections	66-77
Configuring User Attributes	66-79
Viewing the Username Configuration	66-79
Configuring Attributes for Specific Users	66-79
Setting a User Password and Privilege Level	66-80
Configuring User Attributes	66-80
Configuring VPN User Attributes	66-81
Configuring Clientless SSL VPN Access for Specific Users	66-85

CHAPTER 67**Configuring IP Addresses for VPNs 67-1**

Configuring an IP Address Assignment Method	67-1
Configuring Local IP Address Pools	67-2
Configuring AAA Addressing	67-2
Configuring DHCP Addressing	67-3

CHAPTER 68**Configuring Remote Access IPsec VPNs 68-1**

Information About Remote Access IPsec VPNs	68-1
Licensing Requirements for Remote Access IPsec VPNs	68-2

Guidelines and Limitations	68-5
Configuring Remote Access IPsec VPNs	68-5
Configuring Interfaces	68-6
Configuring ISAKMP Policy and Enabling ISAKMP on the Outside Interface	68-6
Configuring an Address Pool	68-8
Adding a User	68-8
Creating an IKEv1 Transform Set or IKEv2 Proposal	68-8
Defining a Tunnel Group	68-9
Creating a Dynamic Crypto Map	68-10
Creating a Crypto Map Entry to Use the Dynamic Crypto Map	68-11
Saving the Security Appliance Configuration	68-12
Configuration Examples for Remote Access IPsec VPNs	68-12
Feature History for Remote Access VPNs	68-13

CHAPTER 69

Configuring Network Admission Control	69-1
Information about Network Admission Control	69-1
Licensing Requirements	69-2
Prerequisites for NAC	69-3
Guidelines and Limitations	69-4
Viewing the NAC Policies on the Security Appliance	69-4
Adding, Accessing, or Removing a NAC Policy	69-6
Configuring a NAC Policy	69-7
Specifying the Access Control Server Group	69-7
Setting the Query-for-Posture-Changes Timer	69-8
Setting the Revalidation Timer	69-9
Configuring the Default ACL for NAC	69-9
Configuring Exemptions from NAC	69-10
Assigning a NAC Policy to a Group Policy	69-12
Changing Global NAC Framework Settings	69-12
Changing Clientless Authentication Settings	69-12
Enabling and Disabling Clientless Authentication	69-13
Changing the Login Credentials Used for Clientless Authentication	69-13
Changing NAC Framework Session Attributes	69-14

CHAPTER 70

Configuring Easy VPN Services on the ASA 5505	70-1
Specifying the Client/Server Role of the Cisco ASA 5505	70-1
Specifying the Primary and Secondary Servers	70-2
Specifying the Mode	70-3

NEM with Multiple Interfaces	70-3
Configuring Automatic Xauth Authentication	70-4
Configuring IPsec Over TCP	70-4
Comparing Tunneling Options	70-5
Specifying the Tunnel Group or Trustpoint	70-6
Specifying the Tunnel Group	70-7
Specifying the Trustpoint	70-7
Configuring Split Tunneling	70-8
Configuring Device Pass-Through	70-8
Configuring Remote Management	70-9
Guidelines for Configuring the Easy VPN Server	70-10
Group Policy and User Attributes Pushed to the Client	70-10
Authentication Options	70-12

CHAPTER 71**Configuring the PPPoE Client 71-1**

PPPoE Client Overview	71-1
Configuring the PPPoE Client Username and Password	71-2
Enabling PPPoE	71-3
Using PPPoE with a Fixed IP Address	71-3
Monitoring and Debugging the PPPoE Client	71-4
Clearing the Configuration	71-5
Using Related Commands	71-5

CHAPTER 72**Configuring LAN-to-LAN IPsec VPNs 72-1**

Summary of the Configuration	72-1
Configuring Interfaces	72-2
Configuring ISAKMP Policy and Enabling ISAKMP on the Outside Interface	72-3
Configuring ISAKMP Policies for IKEv1 Connections	72-4
Configuring ISAKMP Policies for IKEv2 Connections	72-4
Creating an IKEv1 Transform Set	72-5
Creating an IKEv2 Proposal	72-6
Configuring an ACL	72-7
Defining a Tunnel Group	72-7
Creating a Crypto Map and Applying It To an Interface	72-9
Applying Crypto Maps to Interfaces	72-10

CHAPTER 73**Configuring Clientless SSL VPN 73-1**

Information About Clientless SSL VPN 73-1

Licensing Requirements 73-2

Prerequisites for Clientless SSL VPN 73-3

Guidelines and Limitations 73-4

Observing Clientless SSL VPN Security Precautions 73-5

Disabling URL on the Portal Page 73-5

Using SSL to Access the Central Site 73-6

Using HTTPS for Clientless SSL VPN Sessions 73-6

Configuring Clientless SSL VPN and ASDM Ports 73-7

Configuring Support for Proxy Servers 73-7

Configuring SSL/TLS Encryption Protocols 73-10

Authenticating with Digital Certificates 73-10

Enabling Cookies on Browsers for Clientless SSL VPN 73-11

Configuring Application Helper 73-11

Managing Passwords 73-11

Using Single Sign-on with Clientless SSL VPN 73-13

Configuring SSO with HTTP Basic or NTLM Authentication 73-13

Configuring SSO Authentication Using SiteMinder 73-14

Adding the Cisco Authentication Scheme to SiteMinder 73-16

Configuring SSO Authentication Using SAML Browser Post Profile 73-17

Configuring the SAML POST SSO Server 73-19

Configuring SSO with the HTTP Form Protocol 73-20

Gathering HTTP Form Data 73-24

Configuring SSO for Plug-ins 73-28

Configuring SSO with Macro Substitution 73-28

Encoding 73-29

Authenticating with Digital Certificates 73-31

Creating and Applying Clientless SSL VPN Policies for Accessing Resources 73-31

Assigning Users to Group Policies 73-31

Using the Security Appliance Authentication Server 73-31

Using a RADIUS Server 73-31

Using an LDAP Server 73-32

Configuring Connection Profile Attributes for Clientless SSL VPN 73-32

Configuring Group Policy and User Attributes for Clientless SSL VPN 73-33

Configuring Browser Access to Plug-ins 73-34

Preparing the Security Appliance for a Plug-in 73-36

Installing Plug-ins Redistributed By Cisco 73-36

Providing Access to Third-Party Plug-ins	73-38
Configuring and Applying the POST URL	73-39
Providing Access to a Citrix Java Presentation Server	73-39
Preparing the Citrix MetaFrame Server for Clientless SSL VPN Access	73-40
Creating and Installing the Citrix Plug-in	73-40
Viewing the Plug-ins Installed on the Security Appliance	73-41

PART 18

System Administration

CHAPTER 80

Managing Software and Configurations	80-1
Managing the Flash File System	80-1
Viewing Files in Flash Memory	80-1
Deleting Files from Flash Memory	80-2
Downloading Software or Configuration Files to Flash Memory	80-2
Downloading a File to a Specific Location	80-3
Downloading a File to the Startup or Running Configuration	80-3

Configuring the Application Image and ASDM Image to Boot	80-4
Configuring the File to Boot as the Startup Configuration	80-5
Performing Zero Downtime Upgrades for Failover Pairs	80-5
Upgrading an Active/Standby Failover Configuration	80-6
Upgrading an Active/Active Failover Configuration	80-7
Backing Up Configuration Files or Other Files	80-7
Backing up the Single Mode Configuration or Multiple Mode System Configuration	80-8
Backing Up a Context Configuration or Other File in Flash Memory	80-8
Backing Up a Context Configuration within a Context	80-9
Copying the Configuration from the Terminal Display	80-9
Backing Up Additional Files Using the Export and Import Commands	80-9
Using a Script to Back Up and Restore Files	80-10
Prerequisites	80-10
Running the Script	80-10
Sample Script	80-11
Configuring Auto Update Support	80-16
Configuring Communication with an Auto Update Server	80-16
Configuring Client Updates as an Auto Update Server	80-18
Viewing Auto Update Status	80-19
Downgrading Your Software	80-19
Information About Activation Key Compatibility	80-19
Performing the Downgrade	80-20

CHAPTER 81

Troubleshooting 81-1

Testing Your Configuration	81-1
Enabling ICMP Debugging Messages and Syslog Messages	81-2
Pinging ASA Interfaces	81-3
Passing Traffic Through the ASA	81-5
Disabling the Test Configuration	81-7
Determining Packet Routing with Traceroute	81-7
Tracing Packets with Packet Tracer	81-7
Handling TCP Packet Loss	81-8
Reloading the ASA	81-8
Performing Password Recovery	81-8
Recovering Passwords for the ASA	81-9
Disabling Password Recovery	81-10
Resetting the Password on the SSM Hardware Module	81-11
Using the ROM Monitor to Load a Software Image	81-11

Erasing the Flash File System	81-12
Other Troubleshooting Tools	81-13
Viewing Debugging Messages	81-13
Capturing Packets	81-14
Viewing the Crash Dump	81-14
Coredump	81-14
Monitoring Per-Process CPU Usage	81-14
Common Problems	81-14

PART 19

Reviewing the RADIUS Configuration Procedure	C-26
ASA RADIUS Authorization Attributes	C-26
ASA IETF RADIUS Authorization Attributes	C-35
Configuring an External TACACS+ Server	C-36

GLOSSARY

INDEX

About This Guide

This preface introduces *Cisco ASA 5500 Series Configuration Guide using the CLI* and includes the following sections:

- [Document Objectives, page lxiii](#)
- [Audience, page lxiii](#)
- [Related Documentation, page lxiv](#)
- [Conventions, page lxiv](#)
- [Obtaining Documentation and Submitting a Service Request, page lxv](#)

Document Objectives

The purpose of this guide is to help you configure the ASA using the command-line interface. This guide does not cover every feature, but describes only the most common configuration scenarios.

You can also configure and monitor the ASA by using ASDM, a web-based GUI application. ASDM includes configuration wizards to guide you through some common configuration scenarios, and online help for less common scenarios.

This guide applies to the Cisco ASA 5500 series . Throughout this guide, the term “ASA” applies generically to supported models, unless specified otherwise. The PIX 500 security appliances are not supported.

Audience

This guide is for network managers who perform any of the following tasks:

- Manage network security
- Install and configure firewalls/ASAs
- Configure VPNs
- Configure intrusion detection software

Related Documentation

For more information, see *Navigating the Cisco ASA 5500 Series Documentation* at <http://www.cisco.com/en/US/docs/security/asa/roadmap/asaroadmap.html>.

Conventions

This document uses the following conventions:

Convention	Indication
bold font	Commands and keywords and user-entered text appear in bold font .
<i>italic font</i>	Document titles, new or emphasized terms, and arguments for which you supply values are in <i>italic font</i> .
[]	Elements in square brackets are optional.
{ x y z }	Required alternative keywords are grouped in braces and separated by vertical bars.
[x y z]	Optional alternative keywords are grouped in brackets and separated by vertical bars.
string	A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.
courier font	Terminal sessions and information the system displays appear in <code>courier font</code> .
< >	Nonprinting characters such as passwords are in angle brackets.
[]	Default responses to system prompts are in square brackets.
!, #	An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.

Note

Means *reader take note*.

Tip

Means *the following information will help you solve a problem*.

Caution

Means *reader be careful*. In this situation, you might perform an action that could result in equipment damage or loss of data.

Timesaver

Means *the described action saves time*. You can save time by performing the action described in the paragraph.

**Warning**

Means *reader be warned*. In this situation, you might perform an action that could result in bodily injury.

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly *What's New in Cisco Product Documentation*, which also lists all new and revised Cisco technical documentation, at:

<http://www.cisco.com/en/US/docs/general/whatsnew/whatsnew.html>

Subscribe to the *What's New in Cisco Product Documentation* as an RSS feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service. Cisco currently supports RSS Version 2.0.

PART 1

Getting Started with the ASA

CHAPTER 1

Introduction to the Cisco ASA 5500 Series

The ASA provides advanced stateful firewall and VPN concentrator functionality in one device, and for some models, an integrated intrusion prevention system (IPS) module or an integrated content security and control (CSC) module. The ASA includes many advanced features, such as multiple security contexts (similar to virtualized firewalls), transparent (Layer 2) firewall or routed (Layer 3) firewall operation, advanced inspection engines, IPsec VPN, SSL VPN, and clientless SSL VPN support, and many more features.

This chapter includes the following sections:

- [Hardware and Software Compatibility, page 1-1](#)
- [VPN Specifications, page 1-1](#)
- [New Features, page 1-1](#)
- [Firewall Functional Overview, page 1-14](#)
- [VPN Functional Overview, page 1-18](#)
- [Security Context Overview, page 1-19](#)

Hardware and Software Compatibility

For a complete list of supported hardware and software, see the *Cisco ASA Compatibility*:

<http://www.cisco.com/en/US/docs/security/asa/compatibility/asamatrix.html>

VPN Specifications

See *Supported VPN Platforms, Cisco ASA 5500 Series*:

<http://www.cisco.com/en/US/docs/security/asa/compatibility/asa-vpn-compatibility.html>

New Features

This section includes the following topics:

- [New Features in Version 8.4\(3\), page 1-2](#)
- [New Features in Version 8.4\(2\), page 1-4](#)

- [New Features in Version 8.4\(1\), page 1-9](#)

**Note**

New, changed, and deprecated syslog messages are listed in *Cisco ASA 5500 Series System Log Messages*.

New Features in Version 8.4(3)

Released: January 9, 2012

[Table 1-1](#) lists the new features for ASA Version 8.4(3).

Table 1-1 **New Features for ASA Version 8.4(3)**

Feature	Description
NAT Features	
Round robin PAT pool allocation uses the same IP address for existing hosts	When using a PAT pool with round robin allocation, if a host has an existing connection, then subsequent connections from that host will use the same PAT IP address if ports are available. We did not modify any commands. <i>This feature is not available in 8.5(1).</i>
Flat range of PAT ports for a PAT pool	If available, the real source port number is used for the mapped port. However, if the real port is <i>not</i> available, by default the mapped ports are chosen from the same range of ports as the real port number: 0 to 511, 512 to 1023, and 1024 to 65535. Therefore, ports below 1024 have only a small PAT pool. If you have a lot of traffic that uses the lower port ranges, when using a PAT pool, you can now specify a flat range of ports to be used instead of the three unequal-sized tiers: either 1024 to 65535, or 1 to 65535. <i>This feature is not available in 8.5(1).</i>
Extended PAT for a PAT pool	Each PAT IP address allows up to 65535 ports. If 65535 ports do not provide enough translations, you can now enable extended PAT for a PAT pool. Extended PAT uses 65535 ports per <i>service</i>, as opposed to per IP address, by including the destination address and port in the translation information. <i>This feature is not available in 8.5(1).</i>
Configurable timeout for PAT xlate	When a PAT xlate times out (by default after 30 seconds), and the ASA reuses the port for a new translation, some upstream routers might reject the new connection because the previous connection might still be open on the upstream device. The PAT xlate timeout is now configurable, to a value between 30 seconds and 5 minutes. <i>This feature is not available in 8.5(1).</i>

Table 1-1 **New Features for ASA Version 8.4(3) (continued)**

Feature	Description
Automatic NAT rules to translate a VPN peer's local IP address back to the peer's real IP address	In rare situations, you might want to use a VPN peer's real IP address on the inside network instead of an assigned local IP address. Normally with VPN, the peer is given an assigned local IP address to access the inside network. However, you might want to translate the local IP address back to the peer's real public IP address if, for example, your inside servers and network security is based on the peer's real IP address. You can enable this feature on one interface per tunnel group. Object NAT rules are dynamically added and deleted when the VPN session is established or disconnected. You can view the rules using the show nat command. Note Because of routing issues, we do not recommend using this feature unless you know you need this feature; contact Cisco TAC to confirm feature compatibility with your network. See the following limitations: • Only supports Cisco IPsec and AnyConnect Client. • Return traffic to the public IP addresses must be routed back to the ASA so the NAT policy and VPN policy can be applied. • Does not support load-balancing (because of routing issues). • Does not support roaming (public IP changing). We introduced the following command: nat-assigned-to-public-ip interface (tunnel-group general-attributes configuration mode).
Remote Access Features	
Clientless SSL VPN browser support	The ASA now supports clientless SSL VPN with Microsoft Internet Explorer 9 and Firefox 4.
Compression for DTLS and TLS	To improve throughput, Cisco now supports compression for DTLS and TLS on AnyConnect 3.0 or later. Each tunneling method configures compression separately, and the preferred configuration is to have both SSL and DTLS compression as LZS. This feature enhances migration from legacy VPN clients. Note Using data compression on high speed remote access connections passing highly compressible data requires significant processing power on the ASA. With other activity and traffic on the ASA, the number of sessions that can be supported on the platform is reduced. We introduced or modified the following commands: anyconnect dtls compression [lzs none] and anyconnect ssl compression [deflate lzs none].
VPN Session Timeout Alerts	Allows you to create custom messages to alert users that their VPN session is about to end because of inactivity or a session timeout. We introduced the following commands: vpn-session-timeout alert-interval, vpn-idle-timeout alert-interval.
AAA Features	

Table 1-1 **New Features for ASA Version 8.4(3) (continued)**

Feature	Description
Increased maximum LDAP values per attribute	The maximum number of values that the ASA can receive for a single attribute was increased from 1000 (the default) to 5000, with an allowed range of 500 to 5000. If a response message is received that exceeds the configured limit, the ASA rejects the authentication. If the ASA detects that a single attribute has more than 1000 values, then the ASA generates informational syslog 109036. For more than 5000 attributes, the ASA generates error level syslog 109037. We introduced the following command: ldap-max-value-range <i>number</i> (Enter this command in aaa-server host configuration mode).
Support for sub-range of LDAP search results	When an LDAP search results in an attribute with a large number of values, depending on the server configuration, it might return a sub-range of the values and expect the ASA to initiate additional queries for the remaining value ranges. The ASA now makes multiple queries for the remaining ranges, and combines the responses into a complete array of attribute values.
Key vendor-specific attributes (VSAs) sent in RADIUS access request and accounting request packets from the ASA	Four New VSAs—Tunnel Group Name (146) and Client Type (150) are sent in RADIUS access request packets from the ASA. Session Type (151) and Session Subtype (152) are sent in RADIUS accounting request packets from the ASA. All four attributes are sent for all accounting request packet types: Start, Interim-Update, and Stop. The RADIUS server (for example, ACS and ISE) can then enforce authorization and policy attributes or use them for accounting and billing purposes.
Troubleshooting Features	
Regular expression matching for the show asp table classifier and show asp table filter commands	You can now enter the show asp table classifier and show asp table filter commands with a regular expression to filter output. We modified the following commands: show asp table classifier match <i>regex</i>, show asp table filter match <i>regex</i>.

New Features in Version 8.4(2)

Released: June 20, 2011

Table 1-2 lists the new features for ASA Version 8.4(2).

Table 1-2 New Features for ASA Version 8.4(2)

Feature	Description
Firewall Features	
Identity Firewall	Typically, a firewall is not aware of the user identities and, therefore, cannot apply security policies based on identity. The Identity Firewall in the ASA provides more granular access control based on users' identities. You can configure access rules and security policies based on usernames and user groups name rather than through source IP addresses. The ASA applies the security policies based on an association of IP addresses to Windows Active Directory login information and reports events based on the mapped usernames instead of network IP addresses. The Identity Firewall integrates with Window Active Directory in conjunction with an external Active Directory (AD) Agent that provides the actual identity mapping. The ASA uses Windows Active Directory as the source to retrieve the current user identity information for specific IP addresses. In an enterprise, some users log onto the network by using other authentication mechanisms, such as authenticating with a web portal (cut-through proxy) or by using a VPN. You can configure the Identity Firewall to allow these types of authentication in connection with identity-based access policies.
Identity NAT configurable proxy ARP and route lookup	In earlier releases for identity NAT, proxy ARP was disabled, and a route lookup was always used to determine the egress interface. You could not configure these settings. In 8.4(2) and later, the default behavior for identity NAT was changed to match the behavior of other static NAT configurations: proxy ARP is enabled, and the NAT configuration determines the egress interface (if specified) by default. You can leave these settings as is, or you can enable or disable them discretely. Note that you can now also disable proxy ARP for regular static NAT. For pre-8.3 configurations, the migration of NAT exempt rules (the nat 0 access-list command) to 8.4(2) and later now includes the following keywords to disable proxy ARP and to use a route lookup: no-proxy-arp and route-lookup. The unidirectional keyword that was used for migrating to 8.3(2) and 8.4(1) is no longer used for migration. When upgrading to 8.4(2) from 8.3(1), 8.3(2), and 8.4(1), all identity NAT configurations will now include the no-proxy-arp and route-lookup keywords, to maintain existing functionality. The unidirectional keyword is removed.
PAT pool and round robin address assignment	You can now specify a pool of PAT addresses instead of a single address. You can also optionally enable round-robin assignment of PAT addresses instead of first using all ports on a PAT address before using the next address in the pool. These features help prevent a large number of connections from a single PAT address from appearing to be part of a DoS attack and makes configuration of large numbers of PAT addresses easy. Note Currently in 8.4(2), the PAT pool feature is not available as a fallback method for dynamic NAT or PAT. You can only configure the PAT pool as the primary method for dynamic PAT (CSCtq20634).

Table 1-2 **New Features for ASA Version 8.4(2) (continued)**

Feature	Description
IPv6 Inspection	You can configure IPv6 inspection by configuring a service policy to selectively block IPv6 traffic based on the extension header. IPv6 packets are subjected to an early security check. The ASA always passes hop-by-hop and destination option types of extension headers while blocking router header and no next header. You can enable default IPv6 inspection or customize IPv6 inspection. By defining a policy map for IPv6 inspection you can configure the ASA to selectively drop IPv6 packets based on following types of extension headers found anywhere in the IPv6 packet: • Hop-by-Hop Options • Routing (Type 0) • Fragment • Destination Options • Authentication • Encapsulating Security Payload
Remote Access Features	
Portal Access Rules	This enhancement allows customers to configure a global clientless SSL VPN access policy to permit or deny clientless SSL VPN sessions based on the data present in the HTTP header. If denied, an error code is returned to the clients. This denial is performed before user authentication and thus minimizes the use of processing resources. <i>Also available in Version 8.2(5).</i>
Clientless support for Microsoft Outlook Web App 2010	The ASA 8.4(2) clientless SSL VPN core rewriter now supports Microsoft Outlook Web App 2010.
Secure Hash Algorithm SHA-2 Support for IPsec IKEv2 Integrity and PRF	This release supports the Secure Hash Algorithm SHA-2 for increased cryptographic hashing security for IPsec/IKEv2 AnyConnect Secure Mobility Client connections to the ASA. SHA-2 includes hash functions with digests of 256, 384, or 512 bits, to meet U.S. government requirements.
Secure Hash Algorithm SHA-2 Support for Digital Signature over IPsec IKEv2	This release supports the use of SHA-2 compliant signature algorithms to authenticate IPsec IKEv2 VPN connections that use digital certificates, with the hash sizes SHA-256, SHA-384, and SHA-512. SHA-2 digital signature for IPsec IKEv2 connections is supported with the AnyConnect Secure Mobility Client, Version 3.0.1 or later.
Split Tunnel DNS policy for AnyConnect	This release includes a new policy pushed down to the AnyConnect Secure Mobility Client for resolving DNS addresses over split tunnels. This policy applies to VPN connections using the SSL or IPsec/IKEv2 protocol and instructs the AnyConnect client to resolve all DNS addresses through the VPN tunnel. If DNS resolution fails, the address remains unresolved and the AnyConnect client does not try to resolve the address through public DNS servers. By default, this feature is disabled. The client sends DNS queries over the tunnel according to the split tunnel policy: tunnel all networks, tunnel networks specified in a network list, or exclude networks specified in a network list. <i>Also available in Version 8.2(5).</i>

Table 1-2 **New Features for ASA Version 8.4(2) (continued)**

Feature	Description
Mobile Posture (formerly referred to as AnyConnect Identification Extensions for Mobile Device Detection)	You can now configure the ASA to permit or deny VPN connections to mobile devices, enable or disable mobile device access on a per-group basis, and gather information about connected mobile devices based on the mobile device posture data. The following mobile platforms support this capability: AnyConnect for iPhone/iPad/iPod Versions 2.5.x and AnyConnect for Android Version 2.4.x. You do not need to enable CSD to configure these attributes in ASDM. Licensing Requirements Enforcing remote access controls and gathering posture data from mobile devices requires an AnyConnect Mobile license and either an AnyConnect Essentials or AnyConnect Premium license to be installed on the ASA. You receive the following functionality based on the license you install: • AnyConnect Premium License Functionality Enterprises that install the AnyConnect Premium license will be able to enforce DAP policies, on supported mobile devices, based on these DAP attributes and any other existing endpoint attributes. This includes allowing or denying remote access from a mobile device. • AnyConnect Essentials License Functionality Enterprises that install the AnyConnect Essentials license will be able to do the following: – Enable or disable mobile device access on a per-group basis and to configure that feature using ASDM. – Display information about connected mobile devices via CLI or ASDM without having the ability to enforce DAP policies or deny or allow remote access to those mobile devices. <i>Also available in Version 8.2(5).</i>
SSL SHA-2 digital signature	You can now use of SHA-2 compliant signature algorithms to authenticate SSL VPN connections that use digital certificates. Our support for SHA-2 includes all three hash sizes: SHA-256, SHA-384, and SHA-512. SHA-2 requires AnyConnect 2.5(1) or later (2.5(2) or later recommended). This release does not support SHA-2 for other uses or products. Caution: To support failover of SHA-2 connections, the standby ASA must be running the same image. <i>Also available in Version 8.2(5).</i>
SHA2 certificate signature support for Microsoft Windows 7 and Android-native VPN clients	ASA supports SHA2 certificate signature support for Microsoft Windows 7 and Android-native VPN clients when using the L2TP/IPsec protocol. <i>Also available in Version 8.2(5).</i>
Enable/disable certificate mapping to override the group-url attribute	This feature changes the preference of a connection profile during the connection profile selection process. By default, if the ASA matches a certificate field value specified in a connection profile to the field value of the certificate used by the endpoint, the ASA assigns that profile to the VPN connection. This optional feature changes the preference to a connection profile that specifies the group URL requested by the endpoint. The new option lets administrators rely on the group URL preference used by many older ASA software releases. <i>Also available in Version 8.2(5).</i>
ASA 5585-X Features	

Table 1-2 New Features for ASA Version 8.4(2) (continued)

Feature	Description
Support for Dual SSPs for SSP-40 and SSP-60	For SSP-40 and SSP-60, you can use two SSPs of the same level in the same chassis. Mixed-level SSPs are not supported (for example, an SSP-40 with an SSP-60 is not supported). Each SSP acts as an independent device, with separate configurations and management. You can use the two SSPs as a failover pair if desired. Note When using two SSPs in the chassis, VPN is not supported; note, however, that VPN has not been disabled.
Support for the IPS SSP-10, -20, -40, and -60	We introduced support for the IPS SSP-10, -20, -40, and -60 for the ASA 5585-X. You can only install the IPS SSP with a matching-level SSP; for example, SSP-10 and IPS SSP-10. <i>Also available in Version 8.2(5).</i>
CSC SSM Features	
CSC SSM Support	For the CSC SSM, support for the following features has been added: • HTTPS traffic redirection: URL filtering and WRS queries for incoming HTTPS connections. • Configuring global approved whitelists for incoming and outgoing SMTP and POP3 e-mail. • E-mail notification for product license renewals.
Monitoring Features	
Smart Call-Home Anonymous Reporting	Customers can now help to improve the ASA platform by enabling Anonymous Reporting, which allows Cisco to securely receive minimal error and health information from the device. <i>Also available in Version 8.2(5).</i>
IF-MIB ifAlias OID support	The ASA now supports the ifAlias OID. When you browse the IF-MIB, the ifAlias OID will be set to the value that has been set for the interface description. <i>Also available in Version 8.2(5).</i>
Interface Features	
Support for Pause Frames for Flow Control on 1-Gigabit Ethernet Interface	You can now enable pause (XOFF) frames for flow control on 1-Gigabit Ethernet interfaces; support was previously added for 10-Gigabit Ethernet interfaces in 8.2(2). <i>Also available in Version 8.2(5).</i>
Management Features	
Increased SSH security; the SSH default username is no longer supported	Starting in 8.4(2), you can no longer connect to the ASA using SSH with the pix or asa username and the login password. To use SSH, you must configure AAA authentication using the aaa authentication ssh console LOCAL command (CLI) or Configuration > Device Management > Users/AAA > AAA Access > Authentication (ASDM); then define a local user by entering the username command (CLI) or choosing Configuration > Device Management > Users/AAA > User Accounts (ASDM). If you want to use a AAA server for authentication instead of the local database, we recommend also configuring local authentication as a backup method.
Unified Communications Features	

Table 1-2 **New Features for ASA Version 8.4(2) (continued)**

Feature	Description
ASA-Tandberg Interoperability with H.323 Inspection	H.323 Inspection now supports uni-directional signaling for two-way video sessions. This enhancement allows H.323 Inspection of one-way video conferences supported by Tandberg video phones. Supporting uni-directional signaling allows Tandberg phones to switch video modes (close their side of an H.263 video session and reopen the session using H.264, the compression standard for high-definition video). <i>Also available in Version 8.2(5).</i>
Routing Features	
Timeout for connections using a backup static route	When multiple static routes exist to a network with different metrics, the ASA uses the one with the best metric at the time of connection creation. If a better route becomes available, then this timeout lets connections be closed so a connection can be reestablished to use the better route. The default is 0 (the connection never times out). To take advantage of this feature, change the timeout to a new value. <i>Also available in Version 8.2(5).</i>

New Features in Version 8.4(1)

Released: January 31, 2011

[Table 1-3](#) lists the new features for ASA Version 8.4(1).

Table 1-3 **New Features for ASA Version 8.4(1)**

Feature	Description
Hardware Features	
Support for the ASA 5585-X	We introduced support for the ASA 5585-X with Security Services Processor (SSP)-10, -20, -40, and -60. Note Support was previously added in 8.2(3) and 8.2(4); the ASA 5585-X is not supported in 8.3(x).
No Payload Encryption hardware for export	You can purchase the ASA 5585-X with No Payload Encryption. For export to some countries, payload encryption cannot be enabled on the Cisco ASA 5500 series. The ASA software senses a No Payload Encryption model, and disables the following features: - Unified Communications - VPN You can still install the Strong Encryption (3DES/AES) license for use with management connections. For example, you can use ASDM HTTPS/SSL, SSHv2, Telnet and SNMPv3. You can also download the dynamic database for the Botnet Traffic Filer (which uses SSL).
Remote Access Features	
L2TP/IPsec Support on Android Platforms	We now support VPN connections between Android mobile devices and ASA 5500 series devices, when using the L2TP/IPsec protocol and the native Android VPN client. Mobile devices must be using the Android 2.1, or later, operating system. <i>Also available in Version 8.2(5).</i>

Table 1-3 ***New Features for ASA Version 8.4(1) (continued)***

Feature	Description
UTF-8 Character Support for AnyConnect Passwords	AnyConnect 3.0 used with ASA 8.4(1), supports UTF-8 characters in passwords sent using RADIUS/MSCHAP and LDAP protocols.
IPsec VPN Connections with IKEv2	Internet Key Exchange Version 2 (IKEv2) is the latest key exchange protocol used to establish and control Internet Protocol Security (IPsec) tunnels. The ASA now supports IPsec with IKEv2 for the AnyConnect Secure Mobility Client, Version 3.0(1), for all client operating systems. On the ASA, you enable IPsec connections for users in the group policy. For the AnyConnect client, you specify the primary protocol (IPsec or SSL) for each ASA in the server list of the client profile. IPsec remote access VPN using IKEv2 was added to the AnyConnect Essentials and AnyConnect Premium licenses. Site-to-site sessions were added to the Other VPN license (formerly IPsec VPN). The Other VPN license is included in the Base license.
SSL SHA-2 digital signature	This release supports the use of SHA-2 compliant signature algorithms to authenticate SSL VPN connections that use digital certificates. Our support for SHA-2 includes all three hash sizes: SHA-256, SHA-384, and SHA-512. SHA-2 requires AnyConnect 2.5.1 or later (2.5.2 or later recommended). This release does not support SHA-2 for other uses or products. This feature does not involve configuration changes. Caution: To support failover of SHA-2 connections, the standby ASA must be running the same image. To support this feature, we added the Signature Algorithm field to the show crypto ca certificate command to identify the digest algorithm used when generating the signature.
SCEP Proxy	SCEP Proxy provides the AnyConnect Secure Mobility Client with support for automated third-party certificate enrollment. Use this feature to support AnyConnect with zero-touch, secure deployment of device certificates to authorize endpoint connections, enforce policies that prevent access by non-corporate assets, and track corporate assets. This feature requires an AnyConnect Premium license and will not work with an Essentials license.
Host Scan Package Support	This feature provides the necessary support for the ASA to install or upgrade a Host Scan package and enable or disable Host Scan. This package may either be a standalone Host Scan package or one that ASA extracts from an AnyConnect Next Generation package. In previous releases of AnyConnect, an endpoint's posture was determined by Cisco Secure Desktop (CSD). Host Scan was one of many features bundled in CSD. Unbundling Host Scan from CSD gives AnyConnect administrators greater freedom to update and install Host Scan separately from the other features of CSD.

Table 1-3 ***New Features for ASA Version 8.4(1) (continued)***

Feature	Description
Kerberos Constrained Delegation (KCD)	This release implements the KCD protocol transition and constrained delegation extensions on the ASA. KCD provides Clientless SSL VPN (also known as WebVPN) users with SSO access to any web services protected by Kerberos. Examples of such services or applications include Outlook Web Access (OWA), Sharepoint, and Internet Information Server(IIS). Implementing protocol transition allows the ASA to obtain Kerberos service tickets on behalf of remote access users without requiring them to authenticate to the KDC (through Kerberos). Instead, a user authenticates to ASA using any of the supported authentication mechanisms, including digital certificates and Smartcards, for Clientless SSL VPN (also known as WebVPN). When user authentication is complete, the ASA requests and obtains an impersonate ticket, which is a service ticket for ASA on behalf of the user. The ASA may then use the impersonate ticket to obtain other service tickets for the remote access user. Constrained delegation provides a way for domain administrators to limit the network resources that a service trusted for delegation (for example, the ASA) can access. This task is accomplished by configuring the account under which the service is running to be trusted for delegation to a specific instance of a service running on a specific computer.
Clientless SSL VPN browser support	The ASA now supports clientless SSL VPN with Apple Safari 5.
Clientless VPN Auto Sign-on Enhancement	Smart tunnel now supports HTTP-based auto sign-on on Firefox as well as Internet Explorer. Similar to when Internet Explorer is used, the administrator decides to which hosts a Firefox browser will automatically send credentials. For some authentication methods, it may be necessary for the administrator to specify a realm string on the ASA to match that on the web application (in the Add Smart Tunnel Auto Sign-on Server window). You can now use bookmarks with macro substitutions for auto sign-on with Smart tunnel as well. POST plug-in is now obsolete. The former POST plug-in was created so that administrators could specify a bookmark with sign-on macros and receive a kick-off page to load prior to posting the POST request. The post plug-in approach allows requests that required the presence of cookies, and other header items, fetched ahead of time to go through. The administrator can now specify pre-load pages when creating bookmarks to achieve the same functionality. Same as the POST plug-in, the administrator specifies the pre-load page URL and the URL to send the POST request to. You can now replace the default preconfigured SSL VPN portal with your own portal. The administrators do this by specifying a URL as an External Portal. Unlike group-policy home page, External Portal supports POST requests with macro substitution (for auto sign-on) as well as pre-load pages.
Expanded Smart Tunnel application support	Smart Tunnel adds support for the following applications: • Microsoft Outlook Exchange Server 2010 (native support). Users can now use Smart Tunnel to connect Microsoft Office Outlook to a Microsoft Exchange Server. • Microsoft Sharepoint/Office 2010. Users can now perform remote file editing using Microsoft Office 2010 Applications and Microsoft Sharepoint by using Smart Tunnel.

Interface Features

Table 1-3 ***New Features for ASA Version 8.4(1) (continued)***

Feature	Description
EtherChannel support (ASA 5510 and higher)	You can configure up to 48 802.3ad EtherChannels of eight active interfaces each. Note You cannot use interfaces on the 4GE SSM, including the integrated 4GE SSM in slot 1 on the ASA 5550, as part of an EtherChannel.
Bridge groups for transparent mode	If you do not want the overhead of security contexts, or want to maximize your use of security contexts, you can group interfaces together in a bridge group, and then configure multiple bridge groups, one for each network. Bridge group traffic is isolated from other bridge groups. You can configure up to 8 bridge groups in single mode or per context in multiple mode, with 4 interfaces maximum per bridge group. Note Although you can configure multiple bridge groups on the ASA 5505, the restriction of 2 data interfaces in transparent mode on the ASA 5505 means you can only effectively use 1 bridge group.
Scalability Features	
Increased contexts for the ASA 5550, 5580, and 5585-X	For the ASA 5550 and ASA 5585-X with SSP-10, the maximum contexts was increased from 50 to 100. For the ASA 5580 and 5585-X with SSP-20 and higher, the maximum was increased from 50 to 250.
Increased VLANs for the ASA 5580 and 5585-X	For the ASA 5580 and 5585-X, the maximum VLANs was increased from 250 to 1024.
Additional platform support	Google Chrome has been added as a supported platform for ASA Version 8.4. Both 32-bit and 64-bit platforms are supported on Windows XP, Vista, and 7 and Mac OS X Version 6.0.
Increased connections for the ASA 5580 and 5585-X	We increased the firewall connection limits: - ASA 5580-20—1,000,000 to 2,000,000. - ASA 5580-40—2,000,000 to 4,000,000. - ASA 5585-X with SSP-10: 750,000 to 1,000,000. - ASA 5585-X with SSP-20: 1,000,000 to 2,000,000. - ASA 5585-X with SSP-40: 2,000,000 to 4,000,000. - ASA 5585-X with SSP-60: 2,000,000 to 10,000,000.
Increased AnyConnect VPN sessions for the ASA 5580	The AnyConnect VPN session limit was increased from 5,000 to 10,000.
Increased Other VPN sessions for the ASA 5580	The other VPN session limit was increased from 5,000 to 10,000.
High Availability Features	
Stateful Failover with Dynamic Routing Protocols	Routes that are learned through dynamic routing protocols (such as OSPF and EIGRP) on the active unit are now maintained in a Routing Information Base (RIB) table on the standby unit. Upon a failover event, traffic on the secondary active unit now passes with minimal disruption because routes are known.
Unified Communication Features	

Table 1-3 ***New Features for ASA Version 8.4(1) (continued)***

Feature	Description
UC Protocol Inspection Enhancements	SIP Inspection and SCCP Inspection are enhanced to support new features in the Unified Communications Solutions; such as, SCCP v2.0 support, support for GETPORT messages in SCCP Inspection, SDP field support in INVITE messages with SIP Inspection, and QSIG tunneling over SIP. Additionally, the Cisco Intercompany Media Engine supports Cisco RT Lite phones and third-party video endpoints (such as, Tandberg).
Inspection Features	
DCERPC Enhancement	DCERPC Inspection was enhanced to support inspection of RemoteCreateInstance RPC messages.
Troubleshooting and Monitoring Features	
SNMP traps and MIBs	Supports the following additional keywords: connection-limit-reached, entity cpu-temperature, cpu threshold rising, entity fan-failure, entity power-supply, ikev2 stop start, interface-threshold, memory-threshold, nat packet-discard, warmstart. The entPhysicalTable reports entries for sensors, fans, power supplies, and related components. Supports the following additional MIBs: ENTITY-SENSOR-MIB, CISCO-ENTITY-SENSOR-EXT-MIB, CISCO-ENTITY-FRU-CONTROL-MIB, CISCO-PROCESS-MIB, CISCO-ENHANCED-MEMPOOL-MIB, CISCO-L4L7MODULE-RESOURCE-LIMIT-MIB, NAT-MIB, EVENT-MIB, EXPRESSION-MIB Supports the following additional traps: warmstart, cpmCPURisingThreshold, mteTriggerFired, cirResourceLimitReached, natPacketDiscard, ciscoEntSensorExtThresholdNotification.
TCP Ping Enhancement	TCP ping allows users whose ICMP echo requests are blocked to check connectivity over TCP. With the TCP ping enhancement you can specify a source IP address and a port and source interface to send pings to a hostname or an IPv4 address.
Show Top CPU Processes	You can now monitor the processes that run on the CPU to obtain information related to the percentage of the CPU used by any given process. You can also see information about the load on the CPU, broken down per process, at 5 minutes, 1 minute, and 5 seconds prior to the log time. Information is updated automatically every 5 seconds to provide real-time statistics, and a refresh button in the pane allows a manual data refresh at any time.
General Features	
Password Encryption Visibility	You can show password encryption in a security context.

Firewall Functional Overview

Firewalls protect inside networks from unauthorized access by users on an outside network. A firewall can also protect inside networks from each other, for example, by keeping a human resources network separate from a user network. If you have network resources that need to be available to an outside user, such as a web or FTP server, you can place these resources on a separate network behind the firewall, called a *demilitarized zone* (DMZ). The firewall allows limited access to the DMZ, but because the DMZ only includes the public servers, an attack there only affects the servers and does not affect the other inside networks. You can also control when inside users access outside networks (for example, access to the Internet), by allowing only certain addresses out, by requiring authentication or authorization, or by coordinating with an external URL filtering server.

When discussing networks connected to a firewall, the *outside* network is in front of the firewall, the *inside* network is protected and behind the firewall, and a *DMZ*, while behind the firewall, allows limited access to outside users. Because the ASA lets you configure many interfaces with varied security policies, including many inside interfaces, many DMZs, and even many outside interfaces if desired, these terms are used in a general sense only.

This section includes the following topics:

- [Security Policy Overview, page 1-14](#)
- [Firewall Mode Overview, page 1-17](#)
- [Stateful Inspection Overview, page 1-17](#)

Security Policy Overview

A security policy determines which traffic is allowed to pass through the firewall to access another network. By default, the ASA allows traffic to flow freely from an inside network (higher security level) to an outside network (lower security level). You can apply actions to traffic to customize the security policy. This section includes the following topics:

- [Permitting or Denying Traffic with Access Lists, page 1-15](#)
- [Applying NAT, page 1-15](#)
- [Protecting from IP Fragments, page 1-15](#)
- [Using AAA for Through Traffic, page 1-15](#)
- [Applying HTTP, HTTPS, or FTP Filtering, page 1-15](#)
- [Applying Application Inspection, page 1-15](#)
- [Sending Traffic to the IPS Module, page 1-15](#)
- [Sending Traffic to the Content Security and Control Module, page 1-16](#)
- [Applying QoS Policies, page 1-16](#)
- [Applying Connection Limits and TCP Normalization, page 1-16](#)
- [Enabling Threat Detection, page 1-16](#)
- [Enabling the Botnet Traffic Filter, page 1-16](#)
- [Configuring Cisco Unified Communications, page 1-17](#)

Permitting or Denying Traffic with Access Lists

You can apply an access list to limit traffic from inside to outside, or allow traffic from outside to inside. For transparent firewall mode, you can also apply an EtherType access list to allow non-IP traffic.

Applying NAT

Some of the benefits of NAT include the following:

- You can use private addresses on your inside networks. Private addresses are not routable on the Internet.
- NAT hides the local addresses from other networks, so attackers cannot learn the real address of a host.
- NAT can resolve IP routing problems by supporting overlapping IP addresses.

Protecting from IP Fragments

The ASA provides IP fragment protection. This feature performs full reassembly of all ICMP error messages and virtual reassembly of the remaining IP fragments that are routed through the ASA. Fragments that fail the security check are dropped and logged. Virtual reassembly cannot be disabled.

Using AAA for Through Traffic

You can require authentication and/or authorization for certain types of traffic, for example, for HTTP. The ASA also sends accounting information to a RADIUS or TACACS+ server.

Applying HTTP, HTTPS, or FTP Filtering

Although you can use access lists to prevent outbound access to specific websites or FTP servers, configuring and managing web usage this way is not practical because of the size and dynamic nature of the Internet. We recommend that you use the ASA in conjunction with a separate server running one of the following Internet filtering products:

- Websense Enterprise
- Secure Computing SmartFilter

Applying Application Inspection

Inspection engines are required for services that embed IP addressing information in the user data packet or that open secondary channels on dynamically assigned ports. These protocols require the ASA to do a deep packet inspection.

Sending Traffic to the IPS Module

If your model supports the IPS module for intrusion prevention, then you can send traffic to the module for inspection. The IPS module monitors and performs real-time analysis of network traffic by looking for anomalies and misuse based on an extensive, embedded signature library. When the system detects unauthorized activity, it can terminate the specific connection, permanently block the attacking host, log the incident, and send an alert to the device manager. Other legitimate connections continue to operate independently without interruption. For more information, see the documentation for your IPS module.

Sending Traffic to the Content Security and Control Module

If your model supports it, the CSC SSM provides protection against viruses, spyware, spam, and other unwanted traffic. It accomplishes this by scanning the FTP, HTTP, POP3, and SMTP traffic that you configure the ASA to send to it.

Applying QoS Policies

Some network traffic, such as voice and streaming video, cannot tolerate long latency times. QoS is a network feature that lets you give priority to these types of traffic. QoS refers to the capability of a network to provide better service to selected network traffic.

Applying Connection Limits and TCP Normalization

You can limit TCP and UDP connections and embryonic connections. Limiting the number of connections and embryonic connections protects you from a DoS attack. The ASA uses the embryonic limit to trigger TCP Intercept, which protects inside systems from a DoS attack perpetrated by flooding an interface with TCP SYN packets. An embryonic connection is a connection request that has not finished the necessary handshake between source and destination.

TCP normalization is a feature consisting of advanced TCP connection settings designed to drop packets that do not appear normal.

Enabling Threat Detection

You can configure scanning threat detection and basic threat detection, and also how to use statistics to analyze threats.

Basic threat detection detects activity that might be related to an attack, such as a DoS attack, and automatically sends a system log message.

A typical scanning attack consists of a host that tests the accessibility of every IP address in a subnet (by scanning through many hosts in the subnet or sweeping through many ports in a host or subnet). The scanning threat detection feature determines when a host is performing a scan. Unlike IPS scan detection that is based on traffic signatures, the ASA scanning threat detection feature maintains an extensive database that contains host statistics that can be analyzed for scanning activity.

The host database tracks suspicious activity such as connections with no return activity, access of closed service ports, vulnerable TCP behaviors such as non-random IPID, and many more behaviors.

You can configure the ASA to send system log messages about an attacker or you can automatically shun the host.

Enabling the Botnet Traffic Filter

Malware is malicious software that is installed on an unknowing host. Malware that attempts network activity such as sending private data (passwords, credit card numbers, key strokes, or proprietary data) can be detected by the Botnet Traffic Filter when the malware starts a connection to a known bad IP address. The Botnet Traffic Filter checks incoming and outgoing connections against a dynamic database of known bad domain names and IP addresses (the blacklist), and then logs any suspicious activity. When you see syslog messages about the malware activity, you can take steps to isolate and disinfect the host.

Configuring Cisco Unified Communications

The Cisco ASA 5500 series is a strategic platform to provide proxy functions for unified communications deployments. The purpose of a proxy is to terminate and reoriginate connections between a client and server. The proxy delivers a range of security functions such as traffic inspection, protocol conformance, and policy control to ensure security for the internal network. An increasingly popular function of a proxy is to terminate encrypted connections in order to apply security policies while maintaining confidentiality of connections.

Firewall Mode Overview

The ASA runs in two different firewall modes:

- Routed
- Transparent

In routed mode, the ASA is considered to be a router hop in the network.

In transparent mode, the ASA acts like a “bump in the wire,” or a “stealth firewall,” and is not considered a router hop. The ASA connects to the same network on its inside and outside interfaces.

You might use a transparent firewall to simplify your network configuration. Transparent mode is also useful if you want the firewall to be invisible to attackers. You can also use a transparent firewall for traffic that would otherwise be blocked in routed mode. For example, a transparent firewall can allow multicast streams using an EtherType access list.

Stateful Inspection Overview

All traffic that goes through the ASA is inspected using the Adaptive Security Algorithm and either allowed through or dropped. A simple packet filter can check for the correct source address, destination address, and ports, but it does not check that the packet sequence or flags are correct. A filter also checks every packet against the filter, which can be a slow process.

Note

The TCP state bypass feature allows you to customize the packet flow. See the [“TCP State Bypass” section on page 53-3](#).

A stateful firewall like the ASA, however, takes into consideration the state of a packet:

- Is this a new connection?

If it is a new connection, the ASA has to check the packet against access lists and perform other tasks to determine if the packet is allowed or denied. To perform this check, the first packet of the session goes through the “session management path,” and depending on the type of traffic, it might also pass through the “control plane path.”

The session management path is responsible for the following tasks:

- Performing the access list checks
- Performing route lookups
- Allocating NAT translations (xlates)
- Establishing sessions in the “fast path”

Some packets that require Layer 7 inspection (the packet payload must be inspected or altered) are passed on to the control plane path. Layer 7 inspection engines are required for protocols that have two or more channels: a data channel, which uses well-known port numbers, and a control channel, which uses different port numbers for each session. These protocols include FTP, H.323, and SNMP.

- Is this an established connection?

If the connection is already established, the ASA does not need to re-check packets; most matching packets can go through the “fast” path in both directions. The fast path is responsible for the following tasks:

- IP checksum verification
- Session lookup
- TCP sequence number check
- NAT translations based on existing sessions
- Layer 3 and Layer 4 header adjustments

For UDP or other connectionless protocols, the ASA creates connection state information so that it can also use the fast path.

Data packets for protocols that require Layer 7 inspection can also go through the fast path.

Some established session packets must continue to go through the session management path or the control plane path. Packets that go through the session management path include HTTP packets that require inspection or content filtering. Packets that go through the control plane path include the control packets for protocols that require Layer 7 inspection.

VPN Functional Overview

A VPN is a secure connection across a TCP/IP network (such as the Internet) that appears as a private connection. This secure connection is called a tunnel. The ASA uses tunneling protocols to negotiate security parameters, create and manage tunnels, encapsulate packets, transmit or receive them through the tunnel, and unencapsulate them. The ASA functions as a bidirectional tunnel endpoint: it can receive plain packets, encapsulate them, and send them to the other end of the tunnel where they are unencapsulated and sent to their final destination. It can also receive encapsulated packets, unencapsulate them, and send them to their final destination. The ASA invokes various standard protocols to accomplish these functions.

The ASA performs the following functions:

- Establishes tunnels
- Negotiates tunnel parameters
- Authenticates users
- Assigns user addresses
- Encrypts and decrypts data
- Manages security keys
- Manages data transfer across the tunnel
- Manages data transfer inbound and outbound as a tunnel endpoint or router

The ASA invokes various standard protocols to accomplish these functions.

Security Context Overview

You can partition a single ASA into multiple virtual devices, known as security contexts. Each context is an independent device, with its own security policy, interfaces, and administrators. Multiple contexts are similar to having multiple standalone devices. Many features are supported in multiple context mode, including routing tables, firewall features, IPS, and management. Some features are not supported, including VPN and dynamic routing protocols.

In multiple context mode, the ASA includes a configuration for each context that identifies the security policy, interfaces, and almost all the options you can configure on a standalone device. The system administrator adds and manages contexts by configuring them in the system configuration, which, like a single mode configuration, is the startup configuration. The system configuration identifies basic settings for the ASA. The system configuration does not include any network interfaces or network settings for itself; rather, when the system needs to access network resources (such as downloading the contexts from the server), it uses one of the contexts that is designated as the admin context.

The admin context is just like any other context, except that when a user logs into the admin context, then that user has system administrator rights and can access the system and all other contexts.

CHAPTER 2

Getting Started

This chapter describes how to get started with your ASA. This chapter includes the following sections:

- [Accessing the Appliance Command-Line Interface, page 2-1](#)
- [Configuring ASDM Access for Appliances, page 2-2](#)
- [Starting ASDM, page 2-6](#)
- [Factory Default Configurations, page 2-10](#)
- [Working with the Configuration, page 2-15](#)
- [Applying Configuration Changes to Connections, page 2-19](#)

Accessing the Appliance Command-Line Interface

For initial configuration, access the CLI directly from the console port. Later, you can configure remote access using Telnet or SSH according to [Chapter 37, “Configuring Management Access.”](#) If your system is already in multiple context mode, then accessing the console port places you in the system execution space. See [Chapter 5, “Configuring Multiple Context Mode,”](#) for more information about multiple context mode.

Detailed Steps

- Step 1** Connect a PC to the console port using the provided console cable, and connect to the console using a terminal emulator set for 9600 baud, 8 data bits, no parity, 1 stop bit, no flow control.
- See the hardware guide for your ASA for more information about the console cable.
- Step 2** Press the **Enter** key to see the following prompt:
- ```
hostname>
```
- This prompt indicates that you are in user EXEC mode. Only basic commands are available from user EXEC mode.
- Step 3** To access privileged EXEC mode, enter the following command:
- ```
hostname> enable
```
- The following prompt appears:
- ```
Password:
```

All non-configuration commands are available in privileged EXEC mode. You can also enter configuration mode from privileged EXEC mode.

**Step 4** Enter the enable password at the prompt.

By default, the password is blank, and you can press the **Enter** key to continue. See the [“Configuring the Hostname, Domain Name, and Passwords” section on page 10-1](#) to change the enable password.

The prompt changes to:

```
hostname#
```

To exit privileged mode, enter the **disable**, **exit**, or **quit** command.

**Step 5** To access global configuration mode, enter the following command:

```
hostname# configure terminal
```

The prompt changes to the following:

```
hostname(config)#
```

You can begin to configure the ASA from global configuration mode. To exit global configuration mode, enter the **exit**, **quit**, or **end** command.

## Configuring ASDM Access for Appliances

ASDM access requires some minimal configuration so you can communicate over the network with a management interface. This section includes the following topics:

- [Accessing ASDM Using the Factory Default Configuration, page 2-2](#)
- [Accessing ASDM Using a Non-Default Configuration \(ASA 5505\), page 2-3](#)
- [Accessing ASDM Using a Non-Default Configuration \(ASA 5510 and Higher\), page 2-5](#)

### Accessing ASDM Using the Factory Default Configuration

With a factory default configuration (see the [“Factory Default Configurations” section on page 2-10](#)), ASDM connectivity is pre-configured with default network settings. Connect to ASDM using the following interface and network settings:

- The management interface depends on your model:
  - ASA 5505—The switch port to which you connect to ASDM can be any port, except for Ethernet 0/0.
  - ASA 5510 and higher—The interface to which you connect to ASDM is Management 0/0.
- The default management address is 192.168.1.1.
- The clients allowed to access ASDM must be on the 192.168.1.0/24 network. The default configuration enables DHCP so your management station can be assigned an IP address in this range. To allow other client IP addresses to access ASDM, see the [“Configuring ASA Access for ASDM, Telnet, or SSH” section on page 37-1](#).

To launch ASDM, see the [“Starting ASDM” section on page 2-6](#).

**Note**

To change to multiple context mode, see the [“Enabling or Disabling Multiple Context Mode”](#) section on page 5-15. After changing to multiple context mode, you can access ASDM from the admin context using the network settings above.

## Accessing ASDM Using a Non-Default Configuration (ASA 5505)

If you do not have a factory default configuration, or want to change to transparent firewall mode, perform the following steps. See also the sample configurations in the [“ASA 5505 Default Configuration”](#) section on page 2-11.

### Prerequisites

Access the CLI according to the [“Accessing the Appliance Command-Line Interface”](#) section on page 2-1.

### Detailed Steps

|        | Command                                                                                                                                                                                                                                                                                                                                                                                                                                             | Purpose                                                                                                                                                                      |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | (Optional)<br><br><code>firewall transparent</code>                                                                                                                                                                                                                                                                                                                                                                                                 | Enables transparent firewall mode. This command clears your configuration. See the <a href="#">“Configuring the Firewall Mode”</a> section on page 4-1 for more information. |
|        | <b>Example:</b><br><code>hostname(config)# firewall transparent</code>                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                              |
| Step 2 | Do one of the following to configure a management interface, depending on your mode:                                                                                                                                                                                                                                                                                                                                                                | Configures an interface in routed mode. The <b>security-level</b> is a number between 1 and 100, where 100 is the most secure.                                               |
|        | Routed mode:<br><br><code>interface vlan number</code><br><code>ip address ip_address [mask]</code><br><code>nameif name</code><br><code>security-level level</code><br><br><b>Example:</b><br><code>hostname(config)# interface vlan 1</code><br><code>hostname(config-if)# ip address</code><br><code>192.168.1.1 255.255.255.0</code><br><code>hostname(config-if)# nameif inside</code><br><code>hostname(config-if)# security-level 100</code> |                                                                                                                                                                              |

|        | Command                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|        | <p>Transparent mode:</p> <pre> interface bvi number   ip address ip_address [mask]  interface vlan number   bridge-group bvi_number   nameif name   security-level level </pre> <p><b>Example:</b></p> <pre> hostname(config)# interface bvi 1 hostname(config-if)# ip address 192.168.1.1 255.255.255.0  hostname(config)# interface vlan 1 hostname(config-if)# bridge-group 1 hostname(config-if)# nameif inside hostname(config-if)# security-level 100 </pre> | Configures a bridge virtual interface and assigns a management VLAN to the bridge group. The <b>security-level</b> is a number between 1 and 100, where 100 is the most secure.                                                                                                                                                                                                                               |
| Step 3 | <pre> interface ethernet 0/n   switchport access vlan number   no shutdown </pre> <p><b>Example:</b></p> <pre> hostname(config)# interface ethernet 0/1 hostname(config-if)# switchport access vlan 1 hostname(config-if)# no shutdown </pre>                                                                                                                                                                                                                      | Enables the management switchport and assigns it to the management VLAN.                                                                                                                                                                                                                                                                                                                                      |
| Step 4 | <pre> dhcpd address ip_address-ip_address interface_name dhcpd enable interface_name </pre> <p><b>Example:</b></p> <pre> hostname(config)# dhcpd address 192.168.1.5-192.168.1.254 inside hostname(config)# dhcpd enable inside </pre>                                                                                                                                                                                                                             | <p>Enables DHCP for the management host on the management interface network. Make sure you do not include the management address in the range.</p> <p><b>Note</b> By default, the IPS module, if installed, uses 192.168.1.2 for its internal management address, so be sure not to use this address in the DHCP range. You can later change the IPS module management address using the ASA if required.</p> |
| Step 5 | <pre>http server enable</pre> <p><b>Example:</b></p> <pre>hostname(config)# http server enable</pre>                                                                                                                                                                                                                                                                                                                                                               | Enables the HTTP server for ASDM.                                                                                                                                                                                                                                                                                                                                                                             |
| Step 6 | <pre>http ip_address mask interface_name</pre> <p><b>Example:</b></p> <pre>hostname(config)# http 192.168.1.0 255.255.255.0 inside</pre>                                                                                                                                                                                                                                                                                                                           | Allows the management host to access ASDM.                                                                                                                                                                                                                                                                                                                                                                    |
| Step 7 | <pre>write memory</pre> <p><b>Example:</b></p> <pre>hostname(config)# write memory</pre>                                                                                                                                                                                                                                                                                                                                                                           | Saves the configuration.                                                                                                                                                                                                                                                                                                                                                                                      |
| Step 8 | To launch ASDM, see the <a href="#">“Starting ASDM” section on page 2-6</a> .                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                               |

## Examples

The following configuration converts the firewall mode to transparent mode, configures the VLAN 1 interface and assigns it to BVI 1, enables a switchport, and enables ASDM for a management host:

```

firewall transparent
interface bvi 1
 ip address 192.168.1.1 255.255.255.0
interface vlan 1
 bridge-group 1
 nameif inside
 security-level 100
interface ethernet 0/1
 switchport access vlan 1
 no shutdown
dhcpd address 192.168.1.5-192.168.1.254 inside
dhcpd enable inside
http server enable
http 192.168.1.0 255.255.255.0 inside

```

## Accessing ASDM Using a Non-Default Configuration (ASA 5510 and Higher)

If you do not have a factory default configuration, or want to change the firewall or context mode, perform the following steps.

### Prerequisites

Access the CLI according to the [“Accessing the Appliance Command-Line Interface”](#) section on [page 2-1](#).

### Detailed Steps

|        | Command                                                                                                                                                                                                                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                      |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | (Optional)<br><b>firewall transparent</b><br><br><b>Example:</b><br>hostname(config)# firewall transparent                                                                                                                                                                                                                                                                                                                       | Enables transparent firewall mode. This command clears your configuration. See the <a href="#">“Configuring the Firewall Mode”</a> section on <a href="#">page 4-1</a> for more information. |
| Step 2 | <b>interface management 0/0</b><br><b>ip address</b> <i>ip_address mask</i><br><b>nameif</b> <i>name</i><br><b>security-level</b> <i>number</i><br><b>no shutdown</b><br><br><b>Example:</b><br>hostname(config)# interface management 0/0<br>hostname(config-if)# ip address 192.168.1.1 255.255.255.0<br>hostname(config-if)# nameif management<br>hostname(config-if)# security-level 100<br>hostname(config-if)# no shutdown | Configures the Management 0/0 interface. The <b>security-level</b> is a number between 1 and 100, where 100 is the most secure.                                                              |

|        | Command                                                                                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                 |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <b>dhcpcd address</b> <i>ip_address-ip_address</i><br><i>interface_name</i><br><b>dhcpcd enable</b> <i>interface_name</i><br><br><b>Example:</b><br>hostname(config)# dhcpcd address<br>192.168.1.2-192.168.1.254 management<br>hostname(config)# dhcpcd enable management | Enables DHCP for the management host on the management interface network. Make sure you do not include the Management 0/0 address in the range.                                                                                                                         |
| Step 4 | <b>http server enable</b><br><br><b>Example:</b><br>hostname(config)# http server enable                                                                                                                                                                                   | Enables the HTTP server for ASDM.                                                                                                                                                                                                                                       |
| Step 5 | <b>http</b> <i>ip_address mask interface_name</i><br><br><b>Example:</b><br>hostname(config)# http 192.168.1.0<br>255.255.255.0 management                                                                                                                                 | Allows the management host to access ASDM.                                                                                                                                                                                                                              |
| Step 6 | <b>write memory</b><br><br><b>Example:</b><br>hostname(config)# write memory                                                                                                                                                                                               | Saves the configuration.                                                                                                                                                                                                                                                |
| Step 7 | (Optional)<br><br><b>mode multiple</b><br><br><b>Example:</b><br>hostname(config)# mode multiple                                                                                                                                                                           | Sets the mode to multiple mode. When prompted, confirm that you want to convert the existing configuration to be the admin context. You are then prompted to reload the ASDM. See <a href="#">Chapter 5, “Configuring Multiple Context Mode,”</a> for more information. |
| Step 8 | To launch ASDM, see the <a href="#">“Starting ASDM” section on page 2-6.</a>                                                                                                                                                                                               |                                                                                                                                                                                                                                                                         |

## Examples

The following configuration converts the firewall mode to transparent mode, configures the Management 0/0 interface, and enables ASDM for a management host:

```

firewall transparent
interface management 0/0
 ip address 192.168.1.1 255.255.255.0
 nameif management
 security-level 100
 no shutdown
dhcpcd address 192.168.1.2-192.168.1.254 management
dhcpcd enable management
http server enable
http 192.168.1.0 255.255.255.0 management

```

# Starting ASDM

You can start ASDM using two methods:

- **ASDM-IDM Launcher (Windows only)**—The Launcher is an application downloaded from the ASA using a web browser that you can use to connect to any ASA IP address. You do not need to re-download the launcher if you want to connect to other ASAs. The Launcher also lets you run a virtual ASDM in Demo mode using files downloaded locally.
- **Java Web Start**—For each ASA that you manage, you need to connect with a web browser and then save or launch the Java Web Start application. You can optionally save the application to your PC; however you need separate applications for each ASA IP address.

**Note**

Within ASDM, you can choose a different ASA IP address to manage; the difference between the Launcher and Java Web Start application functionality rests primarily in how you initially connect to the ASA and launch ASDM.

This section describes how to connect to ASDM initially, and then launch ASDM using the Launcher or the Java Web Start application. This section includes the following topics:

- [Connecting to ASDM for the First Time, page 2-7](#)
- [Starting ASDM from the ASDM-IDM Launcher, page 2-8](#)
- [Starting ASDM from the Java Web Start Application, page 2-8](#)
- [Using ASDM in Demo Mode, page 2-9](#)

**Note**

ASDM allows multiple PCs or workstations to each have one browser session open with the same ASA software. A single ASA can support up to five concurrent ASDM sessions in single, routed mode. Only one session per browser per PC or workstation is supported for a specified ASA. In multiple context mode, five concurrent ASDM sessions are supported per context, up to a maximum of 32 total connections for each ASA.

## Connecting to ASDM for the First Time

To connect to ASDM for the first time to download the ASDM-IDM Launcher or Java Web Start application, perform the following steps:

**Step 1** From a supported web browser on the ASA network, enter the following URL:

**`https://interface_ip_address/admin`**

Where *interface\_ip\_address* is the management IP address of the ASA. See the [“Configuring ASDM Access for Appliances” section on page 2-2](#) for more information about management access.

See the ASDM release notes for your release for the requirements to run ASDM.

The ASDM launch page appears with the following buttons:

- **Install ASDM Launcher and Run ASDM** (Windows only)
- **Run ASDM**
- **Run Startup Wizard**

**Step 2** To download the Launcher:

- a. Click **Install ASDM Launcher and Run ASDM**.

- b. Enter the username and password, and click **OK**. For a factory default configuration, leave these fields empty. With no HTTPS authentication configured, you can gain access to ASDM with no username and the **enable** password, which is blank by default. With HTTPS authentication enabled, enter your username and associated password.
- c. Save the installer to your PC, and then start the installer. The ASDM-IDM Launcher opens automatically after installation is complete.
- d. See the [“Starting ASDM from the ASDM-IDM Launcher” section on page 2-8](#) to use the Launcher to connect to ASDM.

**Step 3** To use the Java Web Start application:

- a. Click **Run ASDM** or **Run Startup Wizard**.
  - b. Save the application to your PC when prompted. You can optionally open it instead of saving it.
  - c. See the [“Starting ASDM from the Java Web Start Application” section on page 2-8](#) to use the Java Web Start application to connect to ASDM.
- 

## Starting ASDM from the ASDM-IDM Launcher

To start ASDM from the ASDM-IDM Launcher, perform the following steps.

### Prerequisites

Download the ASDM-IDM Launcher according to the [“Connecting to ASDM for the First Time” section on page 2-7](#).

### Detailed Steps

---

**Step 1** Start the ASDM-IDM Launcher application.

**Step 2** Enter or choose the ASA IP address or hostname to which you want to connect. To clear the list of IP addresses, click the trash can icon next to the Device/IP Address/Name field.

**Step 3** Enter your username and your password, and then click **OK**.

For a factory default configuration, leave these fields empty. With no HTTPS authentication configured, you can gain access to ASDM with no username and the **enable** password, which is blank by default. With HTTPS authentication enabled, enter your username and associated password.

If there is a new version of ASDM on the ASA, the ASDM Launcher automatically downloads the new version and requests that you update the current version before starting ASDM.

The main ASDM window appears.

---

## Starting ASDM from the Java Web Start Application

To start ASDM from the Java Web Start application, perform the following steps.

## Prerequisites

Download the Java Web Start application according to the [“Connecting to ASDM for the First Time” section on page 2-7](#).

## Detailed Steps

- 
- |               |                                                                                                                                                                                                                                                                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | Start the Java Web Start application.                                                                                                                                                                                                                                                                                                                  |
| <b>Step 2</b> | Accept any certificates according to the dialog boxes that appear. The Cisco ASDM-IDM Launcher appears.                                                                                                                                                                                                                                                |
| <b>Step 3</b> | Enter the username and password, and click <b>OK</b> . For a factory default configuration, leave these fields empty. With no HTTPS authentication configured, you can gain access to ASDM with no username and the <b>enable</b> password, which is blank by default. With HTTPS authentication enabled, enter your username and associated password. |
- The main ASDM window appears.
- 

## Using ASDM in Demo Mode

The ASDM Demo Mode, a separately installed application, lets you run ASDM without having a live device available. In this mode, you can do the following:

- Perform configuration and selected monitoring tasks via ASDM as though you were interacting with a real device.
- Demonstrate ASDM or ASA features using the ASDM interface.
- Perform configuration and monitoring tasks with the CSC SSM.
- Obtain simulated monitoring and logging data, including real-time syslog messages. The data shown is randomly generated; however, the experience is identical to what you would see when you are connected to a real device.

This mode has been updated to support the following features:

- For global policies, an ASA in single, routed mode and intrusion prevention
- For object NAT, an ASA in single, routed mode and a firewall DMZ.
- For the Botnet Traffic Filter, an ASA in single, routed mode and security contexts.
- Site-to-Site VPN with IPv6 (Clientless SSL VPN and IPsec VPN)
- Promiscuous IDS (intrusion prevention)
- Unified Communication Wizard

This mode does not support the following:

- Saving changes made to the configuration that appear in the GUI.
- File or disk operations.
- Historical monitoring data.
- Non-administrative users.
- These features:
  - File menu:

Save Running Configuration to Flash

Save Running Configuration to TFTP Server

Save Running Configuration to Standby Unit

Save Internal Log Buffer to Flash

Clear Internal Log Buffer

– Tools menu:

Command Line Interface

Ping

File Management

Update Software

File Transfer

Upload Image from Local PC

System Reload

– Toolbar/Status bar > Save

– Configuration > Interface > Edit Interface > Renew DHCP Lease

– Configuring a standby device after failover

- Operations that cause a rereading of the configuration, in which the GUI reverts to the original configuration:

– Switching contexts

– Making changes in the Interface pane

– NAT pane changes

– Clock pane changes

To run ASDM in Demo Mode, perform the following steps:

- 
- Step 1** Download the ASDM Demo Mode installer, `asdm-demo-version.msi`, from the following location:  
<http://www.cisco.com/cisco/web/download/index.html>.
- Step 2** Double-click the installer to install the software.
- Step 3** Double-click the Cisco ASDM Launcher shortcut on your desktop, or open it from the **Start** menu.
- Step 4** Check the **Run in Demo Mode** check box.

The Demo Mode window appears.

---

## Factory Default Configurations

The factory default configuration is the configuration applied by Cisco to new ASAs.

- ASA 5505—The factory default configuration configures interfaces and NAT so that the ASA is ready to use in your network immediately.
- ASA 5510 and higher—The factory default configuration configures an interface for management so you can connect to it using ASDM, with which you can then complete your configuration.

The factory default configuration is available only for routed firewall mode and single context mode. See [Chapter 5, “Configuring Multiple Context Mode,”](#) for more information about multiple context mode. See [Chapter 4, “Configuring the Transparent or Routed Firewall,”](#) for more information about routed and transparent firewall mode. For the ASA 5505, a sample transparent mode configuration is provided in this section.

**Note**

In addition to the image files and the (hidden) default configuration, the following folders and files are standard in flash memory: log/, crypto\_archive/, and coredumpinfo/coredump.cfg. The date on these files may not match the date of the image files in flash memory. These files aid in potential troubleshooting; they do not indicate that a failure has occurred.

This section includes the following topics:

- [Restoring the Factory Default Configuration, page 2-11](#)
- [ASA 5505 Default Configuration, page 2-11](#)
- [ASA 5510 and Higher Default Configuration, page 2-15](#)

## Restoring the Factory Default Configuration

This section describes how to restore the factory default configuration.

### Limitations

This feature is available only in routed firewall mode; transparent mode does not support IP addresses for interfaces. In addition, this feature is available only in single context mode; an ASA with a cleared configuration does not have any defined contexts to configure automatically using this feature.

### Detailed Steps

### What to Do Next

See the [“Working with the Configuration”](#) section on [page 2-15](#) to start configuring the ASA.

## ASA 5505 Default Configuration

The default configuration is available for routed mode only. This section describes the default configuration and also provides a sample transparent mode configuration that you can copy and paste as a starting point. This section includes the following topics:

- [ASA 5505 Routed Mode Default Configuration, page 2-11](#)
- [ASA 5505 Transparent Mode Sample Configuration, page 2-13](#)

### ASA 5505 Routed Mode Default Configuration

The default factory configuration for the ASA 5505 configures the following:

- Interfaces—Inside (VLAN 1) and outside (VLAN 2).
- Switchports enabled and assigned—Ethernet 0/1 through 0/7 switch ports assigned to inside. Ethernet 0/0 assigned to outside.

- IP addresses— Outside address from DHCP; inside address set manually to 192.168.1.1/24.
- Network address translation (NAT)—All inside IP addresses are translated when accessing the outside using interface PAT.
- Traffic flow—IPv4 and IPv6 traffic allowed from inside to outside (this behavior is implicit on the ASA). Outside users are prevented from accessing the inside.
- DHCP server—Enabled for inside hosts, so a PC connecting to the inside interface receives an address between 192.168.1.5 and 192.168.1.254. DNS, WINS, and domain information obtained from the DHCP client on the outside interface is passed to the DHCP clients on the inside interface.
- Default route—Derived from DHCP.
- ASDM access—Inside hosts allowed.

**Figure 2-1 ASA 5505 Routed Mode**

The configuration consists of the following commands:

```
interface Ethernet 0/0
 switchport access vlan 2
 no shutdown
interface Ethernet 0/1
 switchport access vlan 1
 no shutdown
interface Ethernet 0/2
 switchport access vlan 1
 no shutdown
interface Ethernet 0/3
 switchport access vlan 1
 no shutdown
interface Ethernet 0/4
 switchport access vlan 1
 no shutdown
interface Ethernet 0/5
 switchport access vlan 1
 no shutdown
interface Ethernet 0/6
 switchport access vlan 1
 no shutdown
interface Ethernet 0/7
```

```
switchport access vlan 1
no shutdown
interface vlan2
 nameif outside
 no shutdown
 ip address dhcp setroute
interface vlan1
 nameif inside
 ip address 192.168.1.1 255.255.255.0
 security-level 100
 no shutdown
object network obj_any
 subnet 0 0
 nat (inside,outside) dynamic interface
http server enable
http 192.168.1.0 255.255.255.0 inside
dhcpd address 192.168.1.5-192.168.1.254 inside
dhcpd auto_config outside
dhcpd enable inside
logging asdm informational
```

**Note**

For testing purposes, you can allow ping from inside to outside by enabling ICMP inspection. Add the following commands to the default configuration:

```
policy-map global_policy
 class inspection_default
 inspect icmp
```

## ASA 5505 Transparent Mode Sample Configuration

When you change the mode to transparent mode, the configuration is erased. You can copy and paste the following sample configuration at the CLI to get started. This configuration uses the default configuration as a starting point. Note the following areas you may need to modify:

- IP addresses—The IP addresses configured should be changed to match the network to which you are connecting.
- Static routes—For some kinds of traffic, static routes are required. See the [“MAC Address vs. Route Lookups”](#) section on page 4-4.

**Figure 2-2 ASA 5505 Transparent Mode**

```

firewall transparent
interface Ethernet 0/0
 switchport access vlan 2
 no shutdown
interface Ethernet 0/1
 switchport access vlan 1
 no shutdown
interface Ethernet 0/2
 switchport access vlan 1
 no shutdown
interface Ethernet 0/3
 switchport access vlan 1
 no shutdown
interface Ethernet 0/4
 switchport access vlan 1
 no shutdown
interface Ethernet 0/5
 switchport access vlan 1
 no shutdown
interface Ethernet 0/6
 switchport access vlan 1
 no shutdown
interface Ethernet 0/7
 switchport access vlan 1
 no shutdown
interface bvi 1
 ip address 192.168.1.1 255.255.255.0
interface vlan2
 nameif outside
 security-level 0
 bridge-group 1
 no shutdown
interface vlan1
 nameif inside
 security-level 100
 bridge-group 1
 no shutdown
http server enable
http 192.168.1.0 255.255.255.0 inside
dhcpd address 192.168.1.5-192.168.1.254 inside

```

**Note**

```
dhcpd enable inside
```

For testing purposes, you can allow ping from inside to outside by enabling ICMP inspection. Add the following commands to the sample configuration:

```
policy-map global_policy
 class inspection_default
 inspect icmp
```

## ASA 5510 and Higher Default Configuration

The default factory configuration for the ASA 5510 and higher configures the following:

- Management interface—Management 0/0 (management).
- IP address—The management address is 192.168.1.1/24.
- DHCP server—Enabled for management hosts, so a PC connecting to the management interface receives an address between 192.168.1.2 and 192.168.1.254.
- ASDM access—Management hosts allowed.

The configuration consists of the following commands:

```
interface management 0/0
 ip address 192.168.1.1 255.255.255.0
 nameif management
 security-level 100
 no shutdown
asdm logging informational 100
asdm history enable
http server enable
http 192.168.1.0 255.255.255.0 management
dhcpd address 192.168.1.2-192.168.1.254 management
dhcpd lease 3600
dhcpd ping_timeout 750
dhcpd enable management
```

## Working with the Configuration

This section describes how to work with the configuration. The ASA loads the configuration from a text file, called the startup configuration. This file resides by default as a hidden file in internal flash memory. You can, however, specify a different path for the startup configuration. (For more information, see [Chapter 80, “Managing Software and Configurations.”](#))

When you enter a command, the change is made only to the running configuration in memory. You must manually save the running configuration to the startup configuration for your changes to remain after a reboot.

The information in this section applies to both single and multiple security contexts, except where noted. Additional information about contexts is in [Chapter 5, “Configuring Multiple Context Mode.”](#)

This section includes the following topics:

- [Saving Configuration Changes, page 2-16](#)
- [Copying the Startup Configuration to the Running Configuration, page 2-17](#)

- [Viewing the Configuration, page 2-18](#)
- [Clearing and Removing Configuration Settings, page 2-18](#)
- [Creating Text Configuration Files Offline, page 2-19](#)

## Saving Configuration Changes

This section describes how to save your configuration and includes the following topics:

- [Saving Configuration Changes in Single Context Mode, page 2-16](#)
- [Saving Configuration Changes in Multiple Context Mode, page 2-16](#)

### Saving Configuration Changes in Single Context Mode

To save the running configuration to the startup configuration, enter the following command:

| Command                                                | Purpose                                                                                                                         |
|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <code>write memory</code>                              | Saves the running configuration to the startup configuration.                                                                   |
| <b>Example:</b><br><code>hostname# write memory</code> | <b>Note</b> The <code>copy running-config startup-config</code> command is equivalent to the <code>write memory</code> command. |

### Saving Configuration Changes in Multiple Context Mode

You can save each context (and system) configuration separately, or you can save all context configurations at the same time. This section includes the following topics:

- [Saving Each Context and System Separately, page 2-16](#)
- [Saving All Context Configurations at the Same Time, page 2-17](#)

#### Saving Each Context and System Separately

To save the system or context configuration, enter the following command within the system or context:

| Command                                                | Purpose                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>write memory</code>                              | Saves the running configuration to the startup configuration.                                                                                                                                                                                                                             |
| <b>Example:</b><br><code>hostname# write memory</code> | For multiple context mode, context startup configurations can reside on external servers. In this case, the ASA saves the configuration back to the server you identified in the context URL, except for an HTTP or HTTPS URL, which do not let you save the configuration to the server. |
|                                                        | <b>Note</b> The <code>copy running-config startup-config</code> command is equivalent to the <code>write memory</code> command.                                                                                                                                                           |

## Saving All Context Configurations at the Same Time

To save all context configurations at the same time, as well as the system configuration, enter the following command in the system execution space:

| Command                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>write memory all</b> [/noconfirm]<br><br><b>Example:</b><br>hostname# write memory all /noconfirm | <p>Saves the running configuration to the startup configuration for all contexts and the system configuration.</p> <p>If you do not enter the <b>/noconfirm</b> keyword, you see the following prompt:<br/>Are you sure [Y/N]:</p> <p>After you enter <b>Y</b>, the ASA saves the system configuration and each context. Context startup configurations can reside on external servers. In this case, the ASA saves the configuration back to the server you identified in the context URL, except for an HTTP or HTTPS URL, which do not let you save the configuration to the server.</p> |

After the ASA saves each context, the following message appears:

```
'Saving context 'b' ... (1/3 contexts saved) '
```

Sometimes, a context is not saved because of an error. See the following information for errors:

- For contexts that are not saved because of low memory, the following message appears:  
The context 'context a' could not be saved due to Unavailability of resources
- For contexts that are not saved because the remote destination is unreachable, the following message appears:  
The context 'context a' could not be saved due to non-reachability of destination
- For contexts that are not saved because the context is locked, the following message appears:  
Unable to save the configuration for the following contexts as these contexts are locked.  
context 'a' , context 'x' , context 'z' .  
  
A context is only locked if another user is already saving the configuration or in the process of deleting the context.
- For contexts that are not saved because the startup configuration is read-only (for example, on an HTTP server), the following message report is printed at the end of all other messages:  
Unable to save the configuration for the following contexts as these contexts have read-only config-urls:  
context 'a' , context 'b' , context 'c' .
- For contexts that are not saved because of bad sectors in the flash memory, the following message appears:  
The context 'context a' could not be saved due to Unknown errors

## Copying the Startup Configuration to the Running Configuration

Copy a new startup configuration to the running configuration using one of the following options.

| Command                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>copy startup-config running-config</code>                                     | Merges the startup configuration with the running configuration. A merge adds any new commands from the new configuration to the running configuration. If the configurations are the same, no changes occur. If commands conflict or if commands affect the running of the context, then the effect of the merge depends on the command. You might get errors, or you might have unexpected results. |
| <code>reload</code>                                                                 | Reloads the ASA, which loads the startup configuration and discards the running configuration.                                                                                                                                                                                                                                                                                                        |
| <code>clear configure all</code><br><code>copy startup-config running-config</code> | Loads the startup configuration and discards the running configuration without requiring a reload.                                                                                                                                                                                                                                                                                                    |

## Viewing the Configuration

The following commands let you view the running and startup configurations.

| Command                                         | Purpose                                                |
|-------------------------------------------------|--------------------------------------------------------|
| <code>show running-config</code>                | Views the running configuration.                       |
| <code>show running-config</code> <i>command</i> | Views the running configuration of a specific command. |
| <code>show startup-config</code>                | Views the startup configuration.                       |

## Clearing and Removing Configuration Settings

To erase settings, enter one of the following commands.

| Command                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>clear configure</code> <i>configurationcommand</i><br>[ <i>level2configurationcommand</i> ]     | Clears all the configuration for a specified command. If you only want to clear the configuration for a specific version of the command, you can enter a value for <i>level2configurationcommand</i> .                                                                                                                                           |
| <b>Example:</b><br><code>hostname(config)# clear configure aaa</code>                                 | For example, to clear the configuration for all <b>aaa</b> commands, enter the following command:<br><br><code>hostname(config)# clear configure aaa</code><br><br>To clear the configuration for only <b>aaa authentication</b> commands, enter the following command:<br><br><code>hostname(config)# clear configure aaa authentication</code> |
| <code>no</code> <i>configurationcommand</i><br>[ <i>level2configurationcommand</i> ] <i>qualifier</i> | Disables the specific parameters or options of a command. In this case, you use the <b>no</b> command to remove the specific configuration identified by <i>qualifier</i> .                                                                                                                                                                      |
| <b>Example:</b><br><code>hostname(config)# no nat (inside) 1</code>                                   | For example, to remove a specific <b>nat</b> command, enter enough of the command to identify it uniquely as follows:<br><br><code>hostname(config)# no nat (inside) 1</code>                                                                                                                                                                    |

| Command                                                                                    | Purpose                                                                                                                                                                                                                                                                                               |
|--------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>write erase</b><br><br><b>Example:</b><br>hostname(config)# write erase                 | Erases the startup configuration.                                                                                                                                                                                                                                                                     |
| <b>clear configure all</b><br><br><b>Example:</b><br>hostname(config)# clear configure all | Erases the running configuration.<br><br><b>Note</b> In multiple context mode, if you enter <b>clear configure all</b> from the system configuration, you also remove all contexts and stop them from running. The context configuration files are not erased, and remain in their original location. |

## Creating Text Configuration Files Offline

This guide describes how to use the CLI to configure the ASA; when you save commands, the changes are written to a text file. Instead of using the CLI, however, you can edit a text file directly on your PC and paste a configuration at the configuration mode command-line prompt in its entirety, or line by line. Alternatively, you can download a text file to the ASA internal flash memory. See [Chapter 80, “Managing Software and Configurations,”](#) for information on downloading the configuration file to the ASA.

In most cases, commands described in this guide are preceded by a CLI prompt. The prompt in the following example is “hostname(config)#”:

```
hostname(config)# context a
```

In the text configuration file you are not prompted to enter commands, so the prompt is omitted as follows:

```
context a
```

For additional information about formatting the file, see [Appendix A, “Using the Command-Line Interface.”](#)

## Applying Configuration Changes to Connections

When you make security policy changes to the configuration, all *new* connections use the new security policy. Existing connections continue to use the policy that was configured at the time of the connection establishment. To ensure that all connections use the new policy, you need to disconnect the current connections so they can reconnect using the new policy. To disconnect connections, enter one of the following commands:

| Command                                                                                                                                                                                                                                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>clear local-host</b> [ <i>ip_address</i> ] [ <b>all</b> ]<br><br><b>Example:</b><br>hostname(config)# clear local-host all                                                                                                                                                                                                                                                                                              | <p>This command reinitializes per-client run-time states such as connection limits and embryonic limits. As a result, this command removes any connection that uses those limits. See the <b>show local-host all</b> command to view all current connections per host.</p> <p>With no arguments, this command clears all affected through-the-box connections. To also clear to-the-box connections (including your current management session), use the <b>all</b> keyword. To clear connections to and from a particular IP address, use the <i>ip_address</i> argument.</p> |
| <b>clear conn</b> [ <b>all</b> ] [ <b>protocol</b> { <b>tcp</b>   <b>udp</b> }] [ <b>address</b> <i>src_ip</i> [- <i>src_ip</i> ] [ <b>netmask</b> <i>mask</i> ]] [ <b>port</b> <i>src_port</i> [- <i>src_port</i> ]] [ <b>address</b> <i>dest_ip</i> [- <i>dest_ip</i> ] [ <b>netmask</b> <i>mask</i> ]] [ <b>port</b> <i>dest_port</i> [- <i>dest_port</i> ]]<br><br><b>Example:</b><br>hostname(config)# clear conn all | <p>This command terminates connections in any state. See the <b>show conn</b> command to view all current connections.</p> <p>With no arguments, this command clears all through-the-box connections. To also clear to-the-box connections (including your current management session), use the <b>all</b> keyword. To clear specific connections based on the source IP address, destination IP address, port, and/or protocol, you can specify the desired options.</p>                                                                                                      |
| <b>clear xlate</b> [ <i>arguments</i> ]<br><br><b>Example:</b><br>hostname(config)# clear xlate                                                                                                                                                                                                                                                                                                                            | <p>This command clears dynamic NAT sessions; static sessions are not affected. As a result, it removes any connections using those NAT sessions.</p> <p>With no arguments, this command clears all NAT sessions. See the <i>Cisco ASA 5500 Series Command Reference</i> for more information about the arguments available.</p>                                                                                                                                                                                                                                                |

## CHAPTER 3

# Managing Feature Licenses

---

A license specifies the options that are enabled on a given ASA. This document describes how to obtain a license activation key and how to activate it. It also describes the available licenses for each model.

**Note**

This chapter describes licensing for Version 8.4; for other versions, see the licensing documentation that applies to your version:

[http://www.cisco.com/en/US/products/ps6120/products\\_licensing\\_information\\_listing.html](http://www.cisco.com/en/US/products/ps6120/products_licensing_information_listing.html)

---

This chapter includes the following sections:

- [Supported Feature Licenses Per Model, page 3-1](#)
- [Information About Feature Licenses, page 3-15](#)
- [Guidelines and Limitations, page 3-26](#)
- [Configuring Licenses, page 3-27](#)
- [Monitoring Licenses, page 3-33](#)
- [Feature History for Licensing, page 3-41](#)

## Supported Feature Licenses Per Model

This section describes the licenses available for each model as well as important notes about licenses. This section includes the following topics:

- [Licenses Per Model, page 3-1](#)
- [License Notes, page 3-11](#)
- [VPN License and Feature Compatibility, page 3-15](#)

## Licenses Per Model

This section lists the feature licenses available for each model:

- [ASA 5505, page 3-2](#)
- [ASA 5510, page 3-3](#)
- [ASA 5520, page 3-4](#)

- [ASA 5540, page 3-5](#)
- [ASA 5550, page 3-6](#)
- [ASA 5580, page 3-7](#) [ASA 5585-X with SSP-10, page 3-8](#)
- [ASA 5585-X with SSP-20, page 3-9](#)
- [ASA 5585-X with SSP-40 and -60, page 3-10](#)

Items that are in italics are separate, optional licenses with which that you can replace the Base or Security Plus license. You can mix and match licenses, for example, the 24 Unified Communications license plus the Strong Encryption license; or the 500 AnyConnect Premium license plus the GTP/GPRS license; or all four licenses together.

### ASA 5505

**Table 3-1 ASA 5505 License Features**

| Licenses                                              | Description (Base License in Plain Text) |                                            |                                           |    |           | Description (Security Plus Lic. in Plain Text) |                                            |                                           |    |           |
|-------------------------------------------------------|------------------------------------------|--------------------------------------------|-------------------------------------------|----|-----------|------------------------------------------------|--------------------------------------------|-------------------------------------------|----|-----------|
| Firewall Licenses                                     |                                          |                                            |                                           |    |           |                                                |                                            |                                           |    |           |
| Botnet Traffic Filter <sup>1</sup>                    | Disabled                                 |                                            | Opt. Time-based lic: Available            |    |           | Disabled                                       |                                            | Opt. Time-based lic: Available            |    |           |

**Table 3-1 ASA 5505 License Features (continued)**

| Licenses             | Description (Base License in Plain Text)                           | Description (Security Plus Lic. in Plain Text)                    |
|----------------------|--------------------------------------------------------------------|-------------------------------------------------------------------|
| VLANs, maximum       | Routed mode: 3 (2 regular and 1 restricted)<br>Transparent mode: 2 | Routed mode: 20<br>Transparent mode: 3 (2 regular and 1 failover) |
| VLAN Trunks, maximum | No support                                                         | 8 trunks                                                          |

1. See the “License Notes” section on page 3-11.
2. See the “VPN License and Feature Compatibility” section on page 3-15.
3. The total number of VPN sessions depends on your licenses. If you enable AnyConnect Essentials, then the total is the model maximum of 25. If you enable AnyConnect Premium, then the total is the AnyConnect Premium value plus the Other VPN value, not to exceed 25 sessions.
4. In routed mode, hosts on the inside (Business and Home VLANs) count toward the limit when they communicate with the outside (Internet VLAN), including when the inside initiates a connection to the outside as well as when the outside initiates a connection to the inside. Note that even when the outside initiates a connection to the inside, outside hosts are *not* counted toward the limit; only the inside hosts count. Hosts that initiate traffic between Business and Home are also not counted toward the limit. The interface associated with the default route is considered to be the outside Internet interface. If there is no default route, hosts on all interfaces are counted toward the limit. In transparent mode, the interface with the lowest number of hosts is counted toward the host limit. Use the **show local-host** command to view host limits.
5. For a 10-user license, the max. DHCP clients is 32. For 50 users, the max. is 128. For unlimited users, the max. is 250, which is the max. for other models.

1. See the “[License Notes](#)” section on page 3-11.
2. With the 10,000-session UC license, the total combined sessions can be 10,000, but the maximum number of Phone Proxy sessions is 5000.
3. See the “[VPN License and Feature Compatibility](#)” section on page 3-15.

**ASA 5585-X with SSP-40 and -60**

If you have a No Payload Encryption model, then some of the features below are not supported. See the “[No Payload Encryption Models](#)” section on page 3-25 for a list of unsupported features.

**Note**

(8.4(2) and later) For SSP-40 and SSP-60, you can use two SSPs of the same level in the same chassis. Mixed-level SSPs are not supported (for example, an SSP-40 with an SSP-60 is not supported). Each SSP acts as an independent device, with separate configurations and management. You can use the two SSPs as a failover pair if desired. When using two SSPs in the chassis, VPN is not supported; note, however, that VPN has not been disabled.

1. See the “License Notes” section on page 3-11.
2. With the 10,000-session UC license, the total combined sessions can be 10,000, but the maximum number of Phone Proxy sessions is 5000.
3. See the “VPN License and Feature Compatibility” section on page 3-15.

## License Notes

Table 3-10 includes common footnotes shared by multiple tables in the “Licenses Per Model” section on page 3-1.

**Table 3-10** License Notes

| License                        | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AnyConnect Essentials          | <p>AnyConnect Essentials sessions include the following VPN types:</p> <ul style="list-style-type: none"> <li>• SSL VPN</li> <li>• IPsec remote access VPN using IKEv2</li> </ul> <p>This license does not support browser-based (clientless) SSL VPN access or Cisco Secure Desktop. For these features, activate an AnyConnect Premium license instead of the AnyConnect Essentials license.</p> <p><b>Note</b> With the AnyConnect Essentials license, VPN users can use a web browser to log in, and download and start (WebLaunch) the AnyConnect client.</p> <p>The AnyConnect client software offers the same set of client features, whether it is enabled by this license or an AnyConnect Premium license.</p> <p>The AnyConnect Essentials license cannot be active at the same time as the following licenses on a given ASA: AnyConnect Premium license (all types) or the Advanced Endpoint Assessment license. You can, however, run AnyConnect Essentials and AnyConnect Premium licenses on different ASAs in the same network.</p> <p>By default, the ASA uses the AnyConnect Essentials license, but you can disable it to use other licenses by using the <b>no anyconnect-essentials</b> command or in ASDM, using the <b>Configuration &gt; Remote Access VPN &gt; Network (Client) Access &gt; Advanced &gt; AnyConnect Essentials</b> pane.</p> <p>See also the “VPN License and Feature Compatibility” section on page 3-15.</p> |
| AnyConnect for Cisco VPN Phone | In conjunction with an AnyConnect Premium license, this license enables access from hardware IP phones that have built in AnyConnect compatibility.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 3-10 License Notes (continued)

| License                   | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| AnyConnect for Mobile     | <p>This license provides access to the AnyConnect Client for touch-screen mobile devices running Windows Mobile 5.0, 6.0, and 6.1. We recommend using this license if you want to support mobile access to AnyConnect 2.3 and later versions. This license requires activation of one of the following licenses to specify the total number of SSL VPN sessions permitted: AnyConnect Essentials or AnyConnect Premium.</p> <p><b>Mobile Posture Support</b></p> <p>Enforcing remote access controls and gathering posture data from mobile devices requires an AnyConnect Mobile license and either an AnyConnect Essentials or AnyConnect Premium license to be installed on the ASA. Here is the functionality you receive based on the license you install.</p> <ul style="list-style-type: none"> <li>AnyConnect Premium License Functionality <ul style="list-style-type: none"> <li>Enforce DAP policies on supported mobile devices based on DAP attributes and any other existing endpoint attributes. This includes allowing or denying remote access from a mobile device.</li> </ul> </li> <li>AnyConnect Essentials License Functionality <ul style="list-style-type: none"> <li>Enable or disable mobile device access on a per group basis and to configure that feature using ASDM.</li> <li>Display information about connected mobile devices via CLI or ASDM without having the ability to enforce DAP policies or deny or allow remote access to those mobile devices.</li> </ul> </li> </ul> |

| Intercompany Media Engine                | <p>When you enable the Intercompany Media Engine (IME) license, you can use TLS proxy sessions up to the configured TLS proxy limit. If you also have a Unified Communications (UC) license installed that is higher than the default TLS proxy limit, then the ASA sets the limit to be the UC license limit plus an additional number of sessions depending on your model. You can manually configure the TLS proxy limit using the <b>tls-proxy maximum-sessions</b> command or in ASDM, using the <b>Configuration &gt; Firewall &gt; Unified Communications &gt; TLS Proxy</b> pane. To view the limits of your model, enter the <b>tls-proxy maximum-sessions ?</b> command. If you also install the UC license, then the TLS proxy sessions available for UC are also available for IME sessions. For example, if the configured limit is 1000 TLS proxy sessions, and you purchase a 750-session UC license, then the first 250 IME sessions do not affect the sessions available for UC. If you need more than 250 sessions for IME, then the remaining 750 sessions of the platform limit are used on a first-come, first-served basis by UC and IME.</p> <ul style="list-style-type: none"> <li>For a license part number ending in “K8”, TLS proxy sessions are limited to 1000.</li> <li>For a license part number ending in “K9”, the TLS proxy limit depends on your configuration and the platform model.</li> </ul> <p><b>Note</b> K8 and K9 refer to whether the license is restricted for export: K8 is unrestricted, and K9 is restricted.</p> <p>You might also use SRTP encryption sessions for your connections:</p> <ul style="list-style-type: none"> <li>For a K8 license, SRTP sessions are limited to 250.</li> <li>For a K9 license, there is no limit.</li> </ul> <p><b>Note</b> Only calls that require encryption/decryption for media are counted toward the SRTP limit; if passthrough is set for the call, even if both legs are SRTP, they do not count toward the limit.</p> |
| Interfaces of all types, Max.            | The maximum number of combined interfaces; for example, VLANs, physical, redundant, bridge group, and EtherChannel interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UC Phone Proxy sessions | <p>The following applications use TLS proxy sessions for their connections. Each TLS proxy session used by these applications (and only these applications) is counted against the UC license limit:</p> <ul style="list-style-type: none"> <li>• Phone Proxy</li> <li>• Presence Federation Proxy</li> <li>• Encrypted Voice Inspection</li> </ul> <p>Other applications that use TLS proxy sessions do not count toward the UC limit, for example, Mobility Advantage Proxy (which does not require a license) and IME (which requires a separate IME license).</p> <p>Some UC applications might use multiple sessions for a connection. For example, if you configure a phone with a primary and backup Cisco Unified Communications Manager, there are 2 TLS proxy connections, so 2 UC Proxy sessions are used.</p> <p>You independently set the TLS proxy limit using the <b>tls-proxy maximum-sessions</b> command or in ASDM, using the <b>Configuration &gt; Firewall &gt; Unified Communications &gt; TLS Proxy</b> pane. To view the limits of your model, enter the <b>tls-proxy maximum-sessions ?</b> command. When you apply a UC license that is higher than the default TLS proxy limit, the ASA automatically sets the TLS proxy limit to match the UC limit. The TLS proxy limit takes precedence over the UC license limit; if you set the TLS proxy limit to be less than the UC license, then you cannot use all of the sessions in your UC license.</p> <p><b>Note</b> For license part numbers ending in “K8” (for example, licenses under 250 users), TLS proxy sessions are limited to 1000. For license part numbers ending in “K9” (for example, licenses 250 users or larger), the TLS proxy limit depends on the configuration, up to the model limit. K8 and K9 refer to whether the license is restricted for export: K8 is unrestricted, and K9 is restricted.</p> <p>If you clear the configuration (using the <b>clear configure all</b> command, for example), then the TLS proxy limit is set to the default for your model; if this default is lower than the UC license limit, then you see an error message to use the <b>tls-proxy maximum-sessions</b> command to raise the limit again (in ASDM, use the <b>TLS Proxy</b> pane). If you use failover and enter the <b>write standby</b> command or in ASDM, use <b>File &gt; Save Running Configuration to Standby Unit</b> on the primary unit to force a configuration synchronization, the <b>clear configure all</b> command is generated on the secondary unit automatically, so you may see the warning message on the secondary unit. Because the configuration synchronization restores the TLS proxy limit set on the primary unit, you can ignore the warning.</p> <p>You might also use SRTP encryption sessions for your connections:</p> <ul style="list-style-type: none"> <li>• For K8 licenses, SRTP sessions are limited to 250.</li> <li>• For K9 licenses, there is not limit.</li> </ul> <p><b>Note</b> Only calls that require encryption/decryption for media are counted toward the SRTP limit; if passthrough is set for the call, even if both legs are SRTP, they do not count toward the limit.</p> |
| VPN Load Balancing      | VPN load balancing requires a Strong Encryption (3DES/AES) License.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## VPN License and Feature Compatibility

Table 3-11 shows how the VPN licenses and features can combine.

For a detailed list of the features supported by the AnyConnect Essentials license and AnyConnect Premium license, see *AnyConnect Secure Mobility Client Features, Licenses, and OSs*:

- Version 3.0:  
[http://www.cisco.com/en/US/docs/security/vpn\\_client/anyconnect/anyconnect30/feature/guide/anyconnect30features.html](http://www.cisco.com/en/US/docs/security/vpn_client/anyconnect/anyconnect30/feature/guide/anyconnect30features.html)
- Version 2.5:  
[http://www.cisco.com/en/US/docs/security/vpn\\_client/anyconnect/anyconnect25/feature/guide/anyconnect25features.html](http://www.cisco.com/en/US/docs/security/vpn_client/anyconnect/anyconnect25/feature/guide/anyconnect25features.html)

**Table 3-11** VPN License and Feature Compatibility

| Supported with:                    | Enable one of the following licenses: <sup>1</sup> |                    |
|------------------------------------|----------------------------------------------------|--------------------|
|                                    | AnyConnect Essentials                              | AnyConnect Premium |
| AnyConnect for Cisco VPN Phone     | No                                                 | Yes                |
| AnyConnect for Mobile <sup>2</sup> | Yes                                                | Yes                |
| Advanced Endpoint Assessment       | No                                                 | Yes                |
| AnyConnect Premium Shared          | No                                                 | Yes                |
| Client-based SSL VPN               | Yes                                                | Yes                |
| Browser-based (clientless) SSL VPN | No                                                 | Yes                |
| IPsec VPN                          | Yes                                                | Yes                |
| VPN Load Balancing                 | Yes                                                | Yes                |
| Cisco Secure Desktop               | No                                                 | Yes                |

1. You can only have one license type active, either the AnyConnect Essentials license or the AnyConnect Premium license. By default, the ASA includes an AnyConnect Premium license for 2 sessions. If you install the AnyConnect Essentials license, then it is used by default. See the **no anyconnect-essentials** command to enable the Premium license instead.
2. Mobile Posture support is different for the AnyConnect Essentials vs. the AnyConnect Premium license. See Table 3-10 on page 3-11 for details.

## Information About Feature Licenses

A license specifies the options that are enabled on a given ASA. It is represented by an activation key that is a 160-bit (5 32-bit words or 20 bytes) value. This value encodes the serial number (an 11 character string) and the enabled features.

This section includes the following topics:

- [Preinstalled License, page 3-16](#)
- [Permanent License, page 3-16](#)
- [Time-Based Licenses, page 3-16](#)
- [Shared AnyConnect Premium Licenses, page 3-18](#)
- [Failover Licenses \(8.3\(1\) and Later\), page 3-23](#)
- [No Payload Encryption Models, page 3-25](#)
- [Licenses FAQ, page 3-25](#)

## Preinstalled License

By default, your ASA ships with a license already installed. This license might be the Base License, to which you want to add more licenses, or it might already have all of your licenses installed, depending on what you ordered and what your vendor installed for you. See the [“Monitoring Licenses” section on page 3-33](#) to determine which licenses you have installed.

## Permanent License

You can have one permanent activation key installed. The permanent activation key includes all licensed features in a single key. If you also install time-based licenses, the ASA combines the permanent and time-based licenses into a running license. See the [“How Permanent and Time-Based Licenses Combine” section on page 3-17](#) for more information about how the ASA combines the licenses.

## Time-Based Licenses

In addition to permanent licenses, you can purchase time-based licenses or receive an evaluation license that has a time-limit. For example, you might buy a time-based AnyConnect Premium license to handle short-term surges in the number of concurrent SSL VPN users, or you might order a Botnet Traffic Filter time-based license that is valid for 1 year.

This section includes the following topics:

- [Time-Based License Activation Guidelines, page 3-16](#)
- [How the Time-Based License Timer Works, page 3-16](#)
- [How Permanent and Time-Based Licenses Combine, page 3-17](#)
- [Stacking Time-Based Licenses, page 3-18](#)
- [Time-Based License Expiration, page 3-18](#)

### Time-Based License Activation Guidelines

- You can install multiple time-based licenses, including multiple licenses for the same feature. However, only one time-based license per feature can be *active* at a time. The inactive license remains installed, and ready for use. For example, if you install a 1000-session AnyConnect Premium license, and a 2500-session AnyConnect Premium license, then only one of these licenses can be active.
- If you activate an evaluation license that has multiple features in the key, then you cannot also activate another time-based license for one of the included features. For example, if an evaluation license includes the Botnet Traffic Filter and a 1000-session AnyConnect Premium license, you cannot also activate a standalone time-based 2500-session AnyConnect Premium license.

### How the Time-Based License Timer Works

- The timer for the time-based license starts counting down when you activate it on the ASA.
- If you stop using the time-based license before it times out, then the timer halts. The timer only starts again when you reactivate the time-based license.
- If the time-based license is active, and you shut down the ASA, then the timer continues to count down. If you intend to leave the ASA in a shut down state for an extended period of time, then you should deactivate the time-based license before you shut down.

**Note**

We suggest you do not change the system clock after you install the time-based license. If you set the clock to be a later date, then if you reload, the ASA checks the system clock against the original installation time, and assumes that more time has passed than has actually been used. If you set the clock back, and the actual running time is greater than the time between the original installation time and the system clock, then the license immediately expires after a reload.

## How Permanent and Time-Based Licenses Combine

When you activate a time-based license, then features from both permanent and time-based licenses combine to form the running license. How the permanent and time-based licenses combine depends on the type of license. [Table 3-12](#) lists the combination rules for each feature license.

**Note**

Even when the permanent license is used, if the time-based license is active, it continues to count down.

**Table 3-12 Time-Based License Combination Rules**

| Time-Based Feature                    | Combined License Rule                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AnyConnect Premium Sessions           | The higher value is used, either time-based or permanent. For example, if the permanent license is 1000 sessions, and the time-based license is 2500 sessions, then 2500 sessions are enabled. Typically, you will not install a time-based license that has less capability than the permanent license, but if you do so, then the permanent license is used.                                   |
| Unified Communications Proxy Sessions | The time-based license sessions are added to the permanent sessions, up to the platform limit. For example, if the permanent license is 2500 sessions, and the time-based license is 1000 sessions, then 3500 sessions are enabled for as long as the time-based license is active.                                                                                                              |
| Security Contexts                     | The time-based license contexts are added to the permanent contexts, up to the platform limit. For example, if the permanent license is 10 contexts, and the time-based license is 20 contexts, then 30 contexts are enabled for as long as the time-based license is active.                                                                                                                    |
| Botnet Traffic Filter                 | There is no permanent Botnet Traffic Filter license available; the time-based license is used.                                                                                                                                                                                                                                                                                                   |
| All Others                            | The higher value is used, either time-based or permanent. For licenses that have a status of enabled or disabled, then the license with the enabled status is used. For licenses with numerical tiers, the higher value is used. Typically, you will not install a time-based license that has less capability than the permanent license, but if you do so, then the permanent license is used. |

To view the combined license, see the [“Monitoring Licenses” section on page 3-33](#).

## Stacking Time-Based Licenses

In many cases, you might need to renew your time-based license and have a seamless transition from the old license to the new one. For features that are only available with a time-based license, it is especially important that the license not expire before you can apply the new license. The ASA allows you to *stack* time-based licenses so you do not have to worry about the license expiring or about losing time on your licenses because you installed the new one early.

When you install an identical time-based license as one already installed, then the licenses are combined, and the duration equals the combined duration.

For example:

1. You install a 52-week Botnet Traffic Filter license, and use the license for 25 weeks (27 weeks remain).
2. You then purchase another 52-week Botnet Traffic Filter license. When you install the second license, the licenses combine to have a duration of 79 weeks (52 weeks plus 27 weeks).

Similarly:

1. You install an 8-week 1000-session AnyConnect Premium license, and use it for 2 weeks (6 weeks remain).
2. You then install another 8-week 1000-session license, and the licenses combine to be 1000-sessions for 14 weeks (8 weeks plus 6 weeks).

If the licenses are not identical (for example, a 1000-session AnyConnect Premium license vs. a 2500-session license), then the licenses are *not* combined. Because only one time-based license per feature can be active, only one of the licenses can be active. See the [“Activating or Deactivating Keys” section on page 3-28](#) for more information about activating licenses.

Although non-identical licenses do not combine, when the current license expires, the ASA automatically activates an installed license of the same feature if available. See the [“Time-Based License Expiration” section on page 3-18](#) for more information.

## Time-Based License Expiration

When the current license for a feature expires, the ASA automatically activates an installed license of the same feature if available. If there are no other time-based licenses available for the feature, then the permanent license is used.

If you have more than one additional time-based license installed for a feature, then the ASA uses the first license it finds; which license is used is not user-configurable and depends on internal operations. If you prefer to use a different time-based license than the one the ASA activated, then you must manually activate the license you prefer. See the [“Activating or Deactivating Keys” section on page 3-28](#).

For example, you have a time-based 2500-session AnyConnect Premium license (active), a time-based 1000-session AnyConnect Premium license (inactive), and a permanent 500-session AnyConnect Premium license. While the 2500-session license expires, the ASA activates the 1000-session license. After the 1000-session license expires, the ASA uses the 500-session permanent license.

## Shared AnyConnect Premium Licenses

A shared license lets you purchase a large number of AnyConnect Premium sessions and share the sessions as needed among a group of ASAs by configuring one of the ASAs as a shared licensing server, and the rest as shared licensing participants. This section describes how a shared license works and includes the following topics:

- [Information About the Shared Licensing Server and Participants, page 3-19](#)
- [Communication Issues Between Participant and Server, page 3-20](#)
- [Information About the Shared Licensing Backup Server, page 3-20](#)
- [Failover and Shared Licenses, page 3-20](#)
- [Maximum Number of Participants, page 3-22](#)

## Information About the Shared Licensing Server and Participants

The following steps describe how shared licenses operate:

1. Decide which ASA should be the shared licensing server, and purchase the shared licensing server license using that device serial number.
2. Decide which ASAs should be shared licensing participants, including the shared licensing backup server, and obtain a shared licensing participant license for each device, using each device serial number.
3. (Optional) Designate a second ASA as a shared licensing backup server. You can only specify one backup server.

---

**Note** The shared licensing backup server only needs a participant license.

---

4. Configure a shared secret on the shared licensing server; any participants with the shared secret can use the shared license.
5. When you configure the ASA as a participant, it registers with the shared licensing server by sending information about itself, including the local license and model information.

---

**Note** The participant needs to be able to communicate with the server over the IP network; it does not have to be on the same subnet.

---

6. The shared licensing server responds with information about how often the participant should poll the server.
7. When a participant uses up the sessions of the local license, it sends a request to the shared licensing server for additional sessions in 50-session increments.
8. The shared licensing server responds with a shared license. The total sessions used by a participant cannot exceed the maximum sessions for the platform model.

---

**Note** The shared licensing server can also participate in the shared license pool. It does not need a participant license as well as the server license to participate.

---

- a. If there are not enough sessions left in the shared license pool for the participant, then the server responds with as many sessions as available.
  - b. The participant continues to send refresh messages requesting more sessions until the server can adequately fulfill the request.
9. When the load is reduced on a participant, it sends a message to the server to release the shared sessions.

**Note**

The ASA uses SSL between the server and participant to encrypt all communications.

## Communication Issues Between Participant and Server

See the following guidelines for communication issues between the participant and server:

- If a participant fails to send a refresh after 3 times the refresh interval, then the server releases the sessions back into the shared license pool.
- If the participant cannot reach the license server to send the refresh, then the participant can continue to use the shared license it received from the server for up to 24 hours.
- If the participant is still not able to communicate with a license server after 24 hours, then the participant releases the shared license, even if it still needs the sessions. The participant leaves existing connections established, but cannot accept new connections beyond the license limit.
- If a participant reconnects with the server before 24 hours expires, but after the server expired the participant sessions, then the participant needs to send a new request for the sessions; the server responds with as many sessions as can be reassigned to that participant.

## Information About the Shared Licensing Backup Server

The shared licensing backup server must register successfully with the main shared licensing server before it can take on the backup role. When it registers, the main shared licensing server syncs server settings as well as the shared license information with the backup, including a list of registered participants and the current license usage. The main server and backup server sync the data at 10 second intervals. After the initial sync, the backup server can successfully perform backup duties, even after a reload.

When the main server goes down, the backup server takes over server operation. The backup server can operate for up to 30 continuous days, after which the backup server stops issuing sessions to participants, and existing sessions time out. Be sure to reinstate the main server within that 30-day period.

Critical-level syslog messages are sent at 15 days, and again at 30 days.

When the main server comes back up, it syncs with the backup server, and then takes over server operation.

When the backup server is not active, it acts as a regular participant of the main shared licensing server.

**Note**

When you first launch the main shared licensing server, the backup server can only operate independently for 5 days. The operational limit increases day-by-day, until 30 days is reached. Also, if the main server later goes down for any length of time, the backup server operational limit decrements day-by-day. When the main server comes back up, the backup server starts to increment again day-by-day. For example, if the main server is down for 20 days, with the backup server active during that time, then the backup server will only have a 10-day limit left over. The backup server “recharges” up to the maximum 30 days after 20 more days as an inactive backup. This recharging function is implemented to discourage misuse of the shared license.

## Failover and Shared Licenses

This section describes how shared licenses interact with failover and includes the following topics:

- [“Failover and Shared License Servers” section on page 3-21](#)

- [“Failover and Shared License Participants” section on page 3-22](#)

## Failover and Shared License Servers

This section describes how the main server and backup server interact with failover. Because the shared licensing server is also performing normal duties as the ASA, including performing functions such as being a VPN gateway and firewall, then you might need to configure failover for the main and backup shared licensing servers for increased reliability.

**Note**

The backup server mechanism is separate from, but compatible with, failover.

Shared licenses are supported only in single context mode, so Active/Active failover is not supported.

For Active/Standby failover, the primary unit acts as the main shared licensing server, and the standby unit acts as the main shared licensing server after failover. The standby unit does *not* act as the backup shared licensing server. Instead, you can have a second pair of units acting as the backup server, if desired.

For example, you have a network with 2 failover pairs. Pair #1 includes the main licensing server. Pair #2 includes the backup server. When the primary unit from Pair #1 goes down, the standby unit immediately becomes the new main licensing server. The backup server from Pair #2 never gets used. Only if both units in Pair #1 go down does the backup server in Pair #2 come into use as the shared licensing server. If Pair #1 remains down, and the primary unit in Pair #2 goes down, then the standby unit in Pair #2 comes into use as the shared licensing server (see [Figure 3-1](#)).

**Figure 3-1** Failover and Shared License Servers

The standby backup server shares the same operating limits as the primary backup server; if the standby unit becomes active, it continues counting down where the primary unit left off. See the [“Information About the Shared Licensing Backup Server”](#) section on page 3-20 for more information.

### Failover and Shared License Participants

For participant pairs, both units register with the shared licensing server using separate participant IDs. The active unit syncs its participant ID with the standby unit. The standby unit uses this ID to generate a transfer request when it switches to the active role. This transfer request is used to move the shared sessions from the previously active unit to the new active unit.

### Maximum Number of Participants

The ASA does not limit the number of participants for the shared license; however, a very large shared network could potentially affect the performance on the licensing server. In this case, you can increase the delay between participant refreshes, or you can create two shared networks.

## Failover Licenses (8.3(1) and Later)

Failover units do not require the same license on each unit. For earlier versions, see the licensing document for your version.

This section includes the following topics:

- [Failover License Requirements, page 3-23](#)
- [How Failover Licenses Combine, page 3-23](#)
- [Loss of Communication Between Failover Units, page 3-24](#)
- [Upgrading Failover Pairs, page 3-24](#)

### Failover License Requirements

- Failover units do not require the same license on each unit.  
Older versions of ASA software required that the licenses match on each unit. Starting with Version 8.3(1), you no longer need to install identical licenses. Typically, you buy a license only for the primary unit; for Active/Standby failover, the secondary unit inherits the primary license when it becomes active. If you have licenses on both units, they combine into a single running failover cluster license.
- For the ASA 5505 and 5510 ASAs, both units require the Security Plus license; the Base license does not support failover, so you cannot enable failover on a standby unit that only has the Base license.

### How Failover Licenses Combine

For failover pairs, the licenses on each unit are combined into a single running failover cluster license. For Active/Active failover, the license usage of the two units combined cannot exceed the failover cluster license.

If you buy separate licenses for the primary and secondary unit, then the combined license uses the following rules:

- For licenses that have numerical tiers, such as the number of sessions, the values from both the primary and secondary licenses are combined up to the platform limit. If both licenses in use are time-based, then the licenses count down simultaneously.

For example:

- You have two ASAs with 10 AnyConnect Premium sessions installed on each; the licenses will be combined for a total of 20 AnyConnect Premium sessions.
- You have two ASA 5520 ASAs with 500 AnyConnect Premium sessions each; because the platform limit is 750, the combined license allows 750 AnyConnect Premium sessions.

**Note**

In the above example, if the AnyConnect Premium licenses are time-based, you might want to disable one of the licenses so you do not “waste” a 500 session license from which you can only use 250 sessions because of the platform limit.

- You have two ASA 5540 ASAs, one with 20 contexts and the other with 10 contexts; the combined license allows 30 contexts. For Active/Active failover, one unit can use 18 contexts and the other unit can use 12 contexts, for example, for a total of 30; the combined usage cannot exceed the failover cluster license (in this case, 30).
  - For licenses that have a status of enabled or disabled, then the license with the enabled status is used.
  - For time-based licenses that are enabled or disabled (and do not have numerical tiers), the duration is the combined duration of both licenses. The primary unit counts down its license first, and when it expires, the secondary unit starts counting down its license. This rule also applies to Active/Active failover, even though both units are actively operating.
- For example, if you have 48 weeks left on the Botnet Traffic Filter license on both units, then the combined duration is 96 weeks.

To view the combined license, see the [“Monitoring Licenses” section on page 3-33](#).

## Loss of Communication Between Failover Units

If the failover units lose communication for more than 30 days, then each unit reverts to the license installed locally. During the 30-day grace period, the combined running license continues to be used by both units.

If you restore communication during the 30-day grace period, then for time-based licenses, the time elapsed is subtracted from the primary license; if the primary license becomes expired, only then does the secondary license start to count down.

If you do not restore communication during the 30-day period, then for time-based licenses, time is subtracted from both primary and secondary licenses, if installed. They are treated as two separate licenses and do not benefit from the failover combined license. The time elapsed includes the 30-day grace period.

For example:

1. You have a 52-week Botnet Traffic Filter license installed on both units. The combined running license allows a total duration of 104 weeks.
2. The units operate as a failover unit for 10 weeks, leaving 94 weeks on the combined license (42 weeks on the primary, and 52 weeks on the secondary).
3. If the units lose communication (for example the primary unit fails over to the secondary unit), the secondary unit continues to use the combined license, and continues to count down from 94 weeks.
4. The time-based license behavior depends on when communication is restored:
  - Within 30 days—The time elapsed is subtracted from the primary unit license. In this case, communication is restored after 4 weeks. Therefore, 4 weeks are subtracted from the primary license leaving 90 weeks combined (38 weeks on the primary, and 52 weeks on the secondary).
  - After 30 days—The time elapsed is subtracted from both units. In this case, communication is restored after 6 weeks. Therefore, 6 weeks are subtracted from both the primary and secondary licenses, leaving 84 weeks combined (36 weeks on the primary, and 46 weeks on the secondary).

## Upgrading Failover Pairs

Because failover pairs do not require the same license on both units, you can apply new licenses to each unit without any downtime. If you apply a permanent license that requires a reload (see [Table 3-13 on page 3-28](#)), then you can fail over to the other unit while you reload. If both units require reloading, then you can reload them separately so you have no downtime.

## No Payload Encryption Models

You can purchase some models with No Payload Encryption. For export to some countries, payload encryption cannot be enabled on the Cisco ASA 5500 series. The ASA software senses a No Payload Encryption model, and disables the following features:

- Unified Communications
- VPN

You can still install the Strong Encryption (3DES/AES) license for use with management connections. For example, you can use ASDM HTTPS/SSL, SSHv2, Telnet and SNMPv3. You can also download the dynamic database for the Botnet Traffic Filter (which uses SSL).

When you view the license (see the [“Monitoring Licenses” section on page 3-33](#)), VPN and Unified Communications licenses will not be listed.

## Licenses FAQ

- Q.** Can I activate multiple time-based licenses, for example, AnyConnect Premium and Botnet Traffic Filter?
- A.** Yes. You can use one time-based license per feature at a time.
- Q.** Can I “stack” time-based licenses so that when the time limit runs out, it will automatically use the next license?
- A.** Yes. For identical licenses, the time limit is combined when you install multiple time-based licenses. For non-identical licenses (for example, a 1000-session AnyConnect Premium license and a 2500-session license), the ASA automatically activates the next time-based license it finds for the feature.
- Q.** Can I install a new permanent license while maintaining an active time-based license?
- A.** Yes. Activating a permanent license does not affect time-based licenses.
- Q.** For failover, can I use a shared licensing server as the primary unit, and the shared licensing backup server as the secondary unit?
- A.** No. The secondary unit has the same running license as the primary unit; in the case of the shared licensing server, they require a server license. The backup server requires a participant license. The backup server can be in a separate failover pair of two backup servers.
- Q.** Do I need to buy the same licenses for the secondary unit in a failover pair?
- A.** No. Starting with Version 8.3(1), you do not have to have matching licenses on both units. Typically, you buy a license only for the primary unit; the secondary unit inherits the primary license when it becomes active. In the case where you also have a separate license on the secondary unit (for example, if you purchased matching licenses for pre-8.3 software), the licenses are combined into a running failover cluster license, up to the model limits.
- Q.** Can I use a time-based or permanent AnyConnect Premium license in addition to a shared AnyConnect Premium license?
- A.** Yes. The shared license is used only after the sessions from the locally installed license (time-based or permanent) are used up. **Note:** On the shared licensing server, the permanent AnyConnect Premium license is not used; you can however use a time-based license at the same time as the

shared licensing server license. In this case, the time-based license sessions are available for local AnyConnect Premium sessions only; they cannot be added to the shared licensing pool for use by participants.

## Guidelines and Limitations

See the following guidelines for activation keys.

### Context Mode Guidelines

- In multiple context mode, apply the activation key in the system execution space.
- Shared licenses are not supported in multiple context mode.

### Firewall Mode Guidelines

All license types are available in both routed and transparent mode.

### Failover Guidelines

- Shared licenses are not supported in Active/Active mode. See the [“Failover and Shared Licenses” section on page 3-20](#) for more information.
- Failover units do not require the same license on each unit.

Older versions of ASA software required that the licenses match on each unit. Starting with Version 8.3(1), you no longer need to install identical licenses. Typically, you buy a license only for the primary unit; for Active/Standby failover, the secondary unit inherits the primary license when it becomes active. If you have licenses on both units, they combine into a single running failover cluster license.

---

**Note** Failover units do require the same RAM on both units.

---

- For the ASA 5505 and 5510 ASAs, both units require the Security Plus license; the Base license does not support failover, so you cannot enable failover on a standby unit that only has the Base license.

### Upgrade and Downgrade Guidelines

Your activation key remains compatible if you upgrade to the latest version from any previous version. However, you might have issues if you want to maintain downgrade capability:

- Downgrading to Version 8.1 or earlier—After you upgrade, if you activate additional feature licenses that were introduced *before* 8.2, then the activation key continues to be compatible with earlier versions if you downgrade. However if you activate feature licenses that were introduced in 8.2 *or later*, then the activation key is not backwards compatible. If you have an incompatible license key, then see the following guidelines:
  - If you previously entered an activation key in an earlier version, then the ASA uses that key (without any of the new licenses you activated in Version 8.2 or later).
  - If you have a new system and do not have an earlier activation key, then you need to request a new activation key compatible with the earlier version.
- Downgrading to Version 8.2 or earlier—Version 8.3 introduced more robust time-based key usage as well as failover license changes:

- If you have more than one time-based activation key active, when you downgrade, only the most recently activated time-based key can be active. Any other keys are made inactive. If the last time-based license is for a feature introduced in 8.3, then that license still remains the active license even though it cannot be used in earlier versions. Reenter the permanent key or a valid time-based key.
- If you have mismatched licenses on a failover pair, then downgrading will disable failover. Even if the keys are matching, the license used will no longer be a combined license.
- If you have one time-based license installed, but it is for a feature introduced in 8.3, then after you downgrade, that time-based license remains active. You need to reenter the permanent key to disable the time-based license.

#### Additional Guidelines and Limitations

- The activation key is not stored in your configuration file; it is stored as a hidden file in flash memory.
- The activation key is tied to the serial number of the device. Feature licenses cannot be transferred between devices (except in the case of a hardware failure). If you have to replace your device due to a hardware failure, contact the Cisco Licensing Team to have your existing license transferred to the new serial number. The Cisco Licensing Team will ask for the Product Authorization Key reference number and existing serial number.
- Once purchased, you cannot return a license for a refund or for an upgraded license.
- Although you can activate all license types, some features are incompatible with each other; for example, multiple context mode and VPN. In the case of the AnyConnect Essentials license, the license is incompatible with the following licenses: AnyConnect Premium license, shared AnyConnect Premium license, and Advanced Endpoint Assessment license. By default, the AnyConnect Essentials license is used instead of the above licenses, but you can disable the AnyConnect Essentials license in the configuration to restore use of the other licenses using the **no anyconnect-essentials** command.

## Configuring Licenses

This section includes the following topics:

- [Obtaining an Activation Key, page 3-27](#)
- [Activating or Deactivating Keys, page 3-28](#)
- [Configuring a Shared License, page 3-30](#)

## Obtaining an Activation Key

To obtain an activation key, you need a Product Authorization Key, which you can purchase from your Cisco account representative. You need to purchase a separate Product Activation Key for each feature license. For example, if you have the Base License, you can purchase separate keys for Advanced Endpoint Assessment and for additional AnyConnect Premium sessions.

After obtaining the Product Authorization Keys, register them on Cisco.com by performing the following steps.

## Detailed Steps

**Step 1** Obtain the serial number for your ASA by entering the following command.

```
hostname# show activation-key
```

**Step 2** If you are not already registered with Cisco.com, create an account.

**Step 3** Go to the following licensing website:

<http://www.cisco.com/go/license>

**Step 4** Enter the following information, when prompted:

- Product Authorization Key (if you have multiple keys, enter one of the keys first. You have to enter each key as a separate process.)
- The serial number of your ASA
- Your email address

An activation key is automatically generated and sent to the email address that you provide. This key includes all features you have registered so far for permanent licenses. For time-based licenses, each license has a separate activation key.

**Step 5** If you have additional Product Authorization Keys, repeat [Step 4](#) for each Product Authorization Key. After you enter all of the Product Authorization Keys, the final activation key provided includes all of the permanent features you registered.

## Activating or Deactivating Keys

This section describes how to enter a new activation key, and how to activate and deactivate time-based keys.

### Prerequisites

- If you are already in multiple context mode, enter the activation key in the system execution space.
- Some permanent licenses require you to reload the ASA after you activate them. [Table 3-13](#) lists the licenses that require reloading.

**Table 3-13** Permanent License Reloading Requirements

| Model                 | License Action Requiring Reload                                                        |
|-----------------------|----------------------------------------------------------------------------------------|
| ASA 5505 and ASA 5510 | Changing between the Base and Security Plus license.                                   |
| All models            | Changing the Encryption license.                                                       |
| All models            | Downgrading any permanent license (for example, going from 10 contexts to 2 contexts). |

### Limitations and Restrictions

Your activation key remains compatible if you upgrade to the latest version from any previous version. However, you might have issues if you want to maintain downgrade capability:

- Downgrading to Version 8.1 or earlier—After you upgrade, if you activate additional feature licenses that were introduced *before* 8.2, then the activation key continues to be compatible with earlier versions if you downgrade. However if you activate feature licenses that were introduced in 8.2 *or later*, then the activation key is not backwards compatible. If you have an incompatible license key, then see the following guidelines:
  - If you previously entered an activation key in an earlier version, then the ASA uses that key (without any of the new licenses you activated in Version 8.2 or later).
  - If you have a new system and do not have an earlier activation key, then you need to request a new activation key compatible with the earlier version.
- Downgrading to Version 8.2 or earlier—Version 8.3 introduced more robust time-based key usage as well as failover license changes:
  - If you have more than one time-based activation key active, when you downgrade, only the most recently activated time-based key can be active. Any other keys are made inactive.
  - If you have mismatched licenses on a failover pair, then downgrading will disable failover. Even if the keys are matching, the license used will no longer be a combined license.

## Detailed Steps

|        | Command                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>activation-key</b> <i>key</i> [ <b>activate</b>   <b>deactivate</b> ]<br><br><b>Example:</b><br>hostname# activation-key 0xd11b3d48<br>0xa80a4c0a 0x48e0fd1c 0xb0443480<br>0x843fc490 | <p>Applies an activation key to the ASA. The <i>key</i> is a five-element hexadecimal string with one space between each element. The leading 0x specifier is optional; all values are assumed to be hexadecimal.</p> <p>You can install one permanent key, and multiple time-based keys. If you enter a new permanent key, it overwrites the already installed one.</p> <p>The <b>activate</b> and <b>deactivate</b> keywords are available for time-based keys only. If you do not enter any value, <b>activate</b> is the default. The last time-based key that you activate for a given feature is the active one. To deactivate any active time-based key, enter the <b>deactivate</b> keyword. If you enter a key for the first time, and specify <b>deactivate</b>, then the key is installed on the ASA in an inactive state. See the “<a href="#">Time-Based Licenses</a>” section on <a href="#">page 3-16</a> for more information.</p> |
| Step 2 | (Might be required.)<br><br><b>reload</b><br><br><b>Example:</b><br>hostname# reload                                                                                                     | <p>Reloads the ASA. Some permanent licenses require you to reload the ASA after entering the new activation key. See <a href="#">Table 3-13 on page 3-28</a> for a list of licenses that need reloading. If you need to reload, you will see the following message:</p> <p>WARNING: The running activation key was not updated with the requested key. The flash activation key was updated with the requested key, and will become active after the next reload.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Configuring a Shared License

This section describes how to configure the shared licensing server and participants. For more information about shared licenses, see the [“Shared AnyConnect Premium Licenses” section on page 3-18](#).

This section includes the following topics:

- [Configuring the Shared Licensing Server, page 3-30](#)

- [Configuring the Shared Licensing Participant, page 3-32](#)

### Configuring the Shared Licensing Server

This section describes how to configure the ASA to be a shared licensing server.

#### Prerequisites

The server must have a shared licensing server key.

#### Detailed Steps

|        | Command                                                                                                                                                | Purpose                                                                                                                                                                           |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>license-server secret</b> <i>secret</i><br><br><b>Example:</b><br>hostname(config)# license-server secret<br>farscape                               | Sets the shared secret, a string between 4 and 128 ASCII characters. Any participant with this secret can use the licensing server.                                               |
| Step 2 | (Optional)<br><b>license-server refresh-interval</b> <i>seconds</i><br><br><b>Example:</b><br>hostname(config)# license-server<br>refresh-interval 100 | Sets the refresh interval between 10 and 300 seconds; this value is provided to participants to set how often they should communicate with the server. The default is 30 seconds. |
| Step 3 | (Optional)<br><b>license-server port</b> <i>port</i><br><br><b>Example:</b><br>hostname(config)# license-server port<br>40000                          | Sets the port on which the server listens for SSL connections from participants, between 1 and 65535. The default is TCP port 50554.                                              |

|               | Command                                                                                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <p>(Optional)</p> <pre><b>license-server backup</b> address backup-id serial_number [ha-backup-id ha_serial_number]</pre> <p><b>Example:</b></p> <pre>hostname(config)# license-server backup 10.1.1.2 backup-id JMX0916L0Z4 ha-backup-id JMX1378N0W3</pre> | Identifies the backup server IP address and serial number. If the backup server is part of a failover pair, identify the standby unit serial number as well. You can only identify 1 backup server and its optional standby unit. |
| <b>Step 5</b> | <pre><b>license-server enable</b> interface_name</pre> <p><b>Example:</b></p> <pre>hostname(config)# license-server enable inside</pre>                                                                                                                     | Enables this unit to be the shared licensing server. Specify the interface on which participants contact the server. You can repeat this command for as many interfaces as desired.                                               |

## Examples

The following example sets the shared secret, changes the refresh interval and port, configures a backup server, and enables this unit as the shared licensing server on the inside interface and dmz interface:

```
hostname(config)# license-server secret farscape
hostname(config)# license-server refresh-interval 100
hostname(config)# license-server port 40000
hostname(config)# license-server backup 10.1.1.2 backup-id JMX0916L0Z4 ha-backup-id
JMX1378N0W3
hostname(config)# license-server enable inside
hostname(config)# license-server enable dmz
```

## What to Do Next

See the “[Configuring the Shared Licensing Backup Server \(Optional\)](#)” section on page 3-31, or the “[Configuring the Shared Licensing Participant](#)” section on page 3-32.

## Configuring the Shared Licensing Backup Server (Optional)

This section enables a shared license participant to act as the backup server if the main server goes down.

### Prerequisites

The backup server must have a shared licensing participant key.

## Detailed Steps

|        | Command                                                                                                                                                     | Purpose                                                                                                                                                                                    |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>license-server address address secret secret [port port]</b><br><br><b>Example:</b><br>hostname(config)# license-server address 10.1.1.1 secret farscape | Identifies the shared licensing server IP address and shared secret. If you changed the default port in the server configuration, set the port for the backup server to match.             |
| Step 2 | <b>license-server backup enable interface_name</b><br><br><b>Example:</b><br>hostname(config)# license-server backup enable inside                          | Enables this unit to be the shared licensing backup server. Specify the interface on which participants contact the server. You can repeat this command for as many interfaces as desired. |

## Examples

The following example identifies the license server and shared secret, and enables this unit as the backup shared license server on the inside interface and dmz interface:

```
hostname(config)# license-server address 10.1.1.1 secret farscape
hostname(config)# license-server backup enable inside
hostname(config)# license-server backup enable dmz
```

## What to Do Next

See the [“Configuring the Shared Licensing Participant”](#) section on page 3-32.

## Configuring the Shared Licensing Participant

This section configures a shared licensing participant to communicate with the shared licensing server.

## Prerequisites

The participant must have a shared licensing participant key.

## Detailed Steps

|        | Command                                                                                                                                                     | Purpose                                                                                                                                                                      |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>license-server address address secret secret [port port]</b><br><br><b>Example:</b><br>hostname(config)# license-server address 10.1.1.1 secret farscape | Identifies the shared licensing server IP address and shared secret. If you changed the default port in the server configuration, set the port for the participant to match. |
| Step 2 | (Optional)<br><br><b>license-server backup address address</b><br><br><b>Example:</b><br>hostname(config)# license-server backup address 10.1.1.2           | If you configured a backup server, enter the backup server address.                                                                                                          |

## Examples

The following example sets the license server IP address and shared secret, as well as the backup license server IP address:

```
hostname(config)# license-server address 10.1.1.1 secret farscape
hostname(config)# license-server backup address 10.1.1.2
```

# Monitoring Licenses

This section includes the following topics:

- [Viewing Your Current License, page 3-33](#)
- [Monitoring the Shared License, page 3-39](#)

## Viewing Your Current License

This section describes how to view your current license, and for time-based activation keys, how much time the license has left.

### Guidelines

If you have a No Payload Encryption model, then you view the license, VPN and Unified Communications licenses will not be listed. See the [“No Payload Encryption Models” section on page 3-25](#) for more information.

## Detailed Steps

| Command                                                 | Purpose                                                                                                                                                                                                                                           |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show activation-key</b> [ <b>detail</b> ]            | This command shows the permanent license, active time-based licenses, and the running license, which is a combination of the permanent license and active time-based licenses. The <b>detail</b> keyword also shows inactive time-based licenses. |
| <b>Example:</b><br>hostname# show activation-key detail | For failover units, this command also shows the “Failover cluster” license, which is the combined keys of the primary and secondary units.                                                                                                        |

## Examples

### Example 3-1 Standalone Unit Output for the show activation-key command

The following is sample output from the **show activation-key** command for a standalone unit that shows the running license (the combined permanent license and time-based licenses), as well as each active time-based license:

```
hostname# show activation-key

Serial Number: JMX1232L11M
Running Permanent Activation Key: 0xce06dc6b 0x8a7b5ab7 0xale21dd4 0xd2c4b8b8 0xc4594f9c
Running Timebased Activation Key: 0xa821d549 0x35725fe4 0xc918b97b 0xce0b987b 0x47c7c285
Running Timebased Activation Key: 0xyadayad2 0xyadayad2 0xyadayad2 0xyadayad2 0xyadayad2

Licensed features for this platform:
Maximum Physical Interfaces : Unlimited perpetual
Maximum VLANs : 150 perpetual
Inside Hosts : Unlimited perpetual
Failover : Active/Active perpetual
VPN-DES : Enabled perpetual
VPN-3DES-AES : Enabled perpetual
Security Contexts : 10 perpetual
GTP/GPRS : Enabled perpetual

Total VPN Peers : 750 perpetual
Shared License : Enabled perpetual
 Shared AnyConnect Premium Peers : 12000 perpetual
AnyConnect for Mobile : Disabled perpetual
AnyConnect for Cisco VPN Phone : Disabled perpetual
Advanced Endpoint Assessment : Disabled perpetual
UC Phone Proxy Sessions : 12 62 days
Total UC Proxy Sessions : 12 62 days
Botnet Traffic Filter : Enabled 646 days
Intercompany Media Engine : Disabled perpetual

This platform has a Base license.

The flash permanent activation key is the SAME as the running permanent key.

Active Timebased Activation Key:
0xa821d549 0x35725fe4 0xc918b97b 0xce0b987b 0x47c7c285
Botnet Traffic Filter : Enabled 646 days

0xyadayad2 0xyadayad2 0xyadayad2 0xyadayad2 0xyadayad2
Total UC Proxy Sessions : 10 62 days
```

**Example 3-2 Standalone Unit Output for show activation-key detail**

The following is sample output from the **show activation-key detail** command for a standalone unit that shows the running license (the combined permanent license and time-based licenses), as well as the permanent license and each installed time-based license (active and inactive):

```
hostname# show activation-key detail
```

```
Serial Number: 88810093382
Running Permanent Activation Key: 0xce06dc6b 0x8a7b5ab7 0xa1e21dd4 0xd2c4b8b8 0xc4594f9c
Running Timebased Activation Key: 0xa821d549 0x35725fe4 0xc918b97b 0xce0b987b 0x47c7c285
```

Licensed features for this platform:

```
Maximum Physical Interfaces : 8 perpetual
VLANs : 20 DMZ Unrestricted
Dual ISPs : Enabled perpetual
VLAN Trunk Ports : 8 perpetual
Inside Hosts : Unlimited perpetual
Failover : Active/Standby perpetual
VPN-DES : Enabled perpetual
VPN-3DES-AES : Enabled perpetual
AnyConnect Premium Peers : 2 perpetual
AnyConnect Essentials : Disabled perpetual
Other VPN Peers : 25 perpetual
Total VPN Peers : 25 perpetual
AnyConnect for Mobile : Disabled perpetual
AnyConnect for Cisco VPN Phone : Disabled perpetual
Advanced Endpoint Assessment : Disabled perpetual
UC Phone Proxy Sessions : 2 perpetual
Total UC Proxy Sessions : 2 perpetual
Botnet Traffic Filter : Enabled 39 days
Intercompany Media Engine : Disabled perpetual
```

This platform has an ASA 5505 Security Plus license.

```
Running Permanent Activation Key: 0xce06dc6b 0x8a7b5ab7 0xa1e21dd4 0xd2c4b8b8 0xc4594f9c
```

Licensed features for this platform:

```
Maximum Physical Interfaces : 8 perpetual
VLANs : 20 DMZ Unrestricted
Dual ISPs : Enabled perpetual
VLAN Trunk Ports : 8 perpetual
Inside Hosts : Unlimited perpetual
Failover : Active/Standby perpetual
VPN-DES : Enabled perpetual
VPN-3DES-AES : Enabled perpetual
AnyConnect Premium Peers : 2 perpetual
AnyConnect Essentials : Disabled perpetual
Other VPN Peers : 25 perpetual
Total VPN Peers : 25 perpetual
AnyConnect for Mobile : Disabled perpetual
AnyConnect for Cisco VPN Phone : Disabled perpetual
Advanced Endpoint Assessment : Disabled perpetual
UC Phone Proxy Sessions : 2 perpetual
Total UC Proxy Sessions : 2 perpetual
Botnet Traffic Filter : Enabled 39 days
Intercompany Media Engine : Disabled perpetual
```

The flash permanent activation key is the SAME as the running permanent key.

```
Active Timebased Activation Key:
```

```

0xa821d549 0x35725fe4 0xc918b97b 0xce0b987b 0x47c7c285
Botnet Traffic Filter : Enabled 39 days

Inactive Timebased Activation Key:
0xyadayada3 0xyadayada3 0xyadayada3 0xyadayada3 0xyadayada3
AnyConnect Premium Peers : 25 7 days

```

### Example 3-3 Primary Unit Output in a Failover Pair for show activation-key detail

The following is sample output from the **show activation-key detail** command for the primary failover unit that shows:

- The primary unit license (the combined permanent license and time-based licenses).
- The “Failover Cluster” license, which is the combined licenses from the primary and secondary units. This is the license that is actually running on the ASA. The values in this license that reflect the combination of the primary and secondary licenses are in bold.
- The primary unit permanent license.
- The primary unit installed time-based licenses (active and inactive).

```
hostname# show activation-key detail
```

```

Serial Number: P3000000171
Running Permanent Activation Key: 0xce06dc6b 0x8a7b5ab7 0xale21dd4 0xd2c4b8b8 0xc4594f9c
Running Timebased Activation Key: 0xa821d549 0x35725fe4 0xc918b97b 0xce0b987b 0x47c7c285

```

Licensed features for this platform:

```

Maximum Physical Interfaces : Unlimited perpetual
Maximum VLANs : 150 perpetual
Inside Hosts : Unlimited perpetual
Failover : Active/Active perpetual
VPN-DES : Enabled perpetual
VPN-3DES-AES : Enabled perpetual
Security Contexts : 12 perpetual
GTP/GPRS : Enabled perpetual
AnyConnect Premium Peers : 2 perpetual
AnyConnect Essentials : Disabled perpetual
Other VPN Peers : 750 perpetual
Total VPN Peers : 750 perpetual
Shared License : Disabled perpetual
AnyConnect for Mobile : Disabled perpetual
AnyConnect for Cisco VPN Phone : Disabled perpetual
Advanced Endpoint Assessment : Disabled perpetual
UC Phone Proxy Sessions : 2 perpetual
Total UC Proxy Sessions : 2 perpetual
Botnet Traffic Filter : Enabled 33 days
Intercompany Media Engine : Disabled perpetual

```

This platform has an ASA 5520 VPN Plus license.

Failover cluster licensed features for this platform:

```

Maximum Physical Interfaces : Unlimited perpetual
Maximum VLANs : 150 perpetual
Inside Hosts : Unlimited perpetual
Failover : Active/Active perpetual
VPN-DES : Enabled perpetual
VPN-3DES-AES : Enabled perpetual
Security Contexts : 12 perpetual
GTP/GPRS : Enabled perpetual
AnyConnect Premium Peers : 4 perpetual
AnyConnect Essentials : Disabled perpetual

```

```

Other VPN Peers : 750 perpetual
Total VPN Peers : 750 perpetual
Shared License : Disabled perpetual
AnyConnect for Mobile : Disabled perpetual
AnyConnect for Cisco VPN Phone : Disabled perpetual
Advanced Endpoint Assessment : Disabled perpetual
UC Phone Proxy Sessions : 4 perpetual
Total UC Proxy Sessions : 4 perpetual
Botnet Traffic Filter : Enabled 33 days
Intercompany Media Engine : Disabled perpetual

```

This platform has an ASA 5520 VPN Plus license.

Running Permanent Activation Key: 0xce06dc6b 0x8a7b5ab7 0xa1e21dd4 0xd2c4b8b8 0xc4594f9c

Licensed features for this platform:

```

Maximum Physical Interfaces : Unlimited perpetual
Maximum VLANs : 150 perpetual
Inside Hosts : Unlimited perpetual
Failover : Active/Active perpetual
VPN-DES : Enabled perpetual
VPN-3DES-AES : Disabled perpetual
Security Contexts : 2 perpetual
GTP/GPRS : Disabled perpetual
AnyConnect Premium Peers : 2 perpetual
AnyConnect Essentials : Disabled perpetual
Other VPN Peers : 750 perpetual
Total VPN Peers : 750 perpetual
Shared License : Disabled perpetual
AnyConnect for Mobile : Disabled perpetual
AnyConnect for Cisco VPN Phone : Disabled perpetual
Advanced Endpoint Assessment : Disabled perpetual
UC Phone Proxy Sessions : 2 perpetual
Total UC Proxy Sessions : 2 perpetual
Botnet Traffic Filter : Disabled perpetual
Intercompany Media Engine : Disabled perpetual

```

The flash permanent activation key is the SAME as the running permanent key.

Active Timebased Activation Key:

```

0xa821d549 0x35725fe4 0xc918b97b 0xce0b987b 0x47c7c285
Botnet Traffic Filter : Enabled 33 days

```

Inactive Timebased Activation Key:

```

0xyadayad3 0xyadayad3 0xyadayad3 0xyadayad3 0xyadayad3
Security Contexts : 2 7 days
AnyConnect Premium Peers : 100 7 days

```

```

0xyadayad4 0xyadayad4 0xyadayad4 0xyadayad4 0xyadayad4
Total UC Proxy Sessions : 100 14 days

```

### Example 3-4 Secondary Unit Output in a Failover Pair for show activation-key detail

The following is sample output from the **show activation-key detail** command for the secondary failover unit that shows:

- The secondary unit license (the combined permanent license and time-based licenses).
- The “Failover Cluster” license, which is the combined licenses from the primary and secondary units. This is the license that is actually running on the ASA. The values in this license that reflect the combination of the primary and secondary licenses are in bold.

- The secondary unit permanent license.
- The secondary installed time-based licenses (active and inactive). This unit does not have any time-based licenses, so none display in this sample output.

hostname# **show activation-key detail**

Serial Number: P3000000011

Running Activation Key: Oxyadayad1 Oxyadayad1 Oxyadayad1 Oxyadayad1 Oxyadayad1

Licensed features for this platform:

|                                |                 |           |
|--------------------------------|-----------------|-----------|
| Maximum Physical Interfaces    | : Unlimited     | perpetual |

The flash permanent activation key is the SAME as the running permanent key.

## Monitoring the Shared License

To monitor the shared license, enter one of the following commands.

| Command                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show shared license</b> [ <b>detail</b>   <b>client</b><br>[ <i>hostname</i> ]   <b>backup</b> ] | Shows shared license statistics. Optional keywords are available only for the licensing server: the <b>detail</b> keyword shows statistics per participant. To limit the display to one participant, use the <b>client</b> keyword. The <b>backup</b> keyword shows information about the backup server.<br><br>To clear the shared license statistics, enter the <b>clear shared license</b> command. |
| <b>show activation-key</b>                                                                          | Shows the licenses installed on the ASA. The <b>show version</b> command also shows license information.                                                                                                                                                                                                                                                                                               |
| <b>show vpn-sessiondb</b>                                                                           | Shows license information about VPN sessions.                                                                                                                                                                                                                                                                                                                                                          |

### Examples

The following is sample output from the **show shared license** command on the license participant:

```

hostname> show shared license
Primary License Server : 10.3.32.20
 Version : 1
 Status : Inactive

Shared license utilization:
SSLVPN:
 Total for network : 5000
 Available : 5000
 Utilized : 0
This device:
 Platform limit : 250
 Current usage : 0
 High usage : 0

```

```
Messages Tx/Rx/Error:
 Registration : 0 / 0 / 0
 Get : 0 / 0 / 0
 Release : 0 / 0 / 0
 Transfer : 0 / 0 / 0
```

The following is sample output from the **show shared license detail** command on the license server:

```
hostname> show shared license detail
Backup License Server Info:
```

```
Device ID : ABCD
Address : 10.1.1.2
Registered : NO
HA peer ID : EFGH
Registered : NO
 Messages Tx/Rx/Error:
 Hello : 0 / 0 / 0
 Sync : 0 / 0 / 0
 Update : 0 / 0 / 0
```

Shared license utilization:

```
SSLVPN:
 Total for network : 500
 Available : 500
 Utilized : 0
This device:
 Platform limit : 250
 Current usage : 0
 High usage : 0
 Messages Tx/Rx/Error:
 Registration : 0 / 0 / 0
 Get : 0 / 0 / 0
 Release : 0 / 0 / 0
 Transfer : 0 / 0 / 0
```

Client Info:

```
Hostname : 5540-A
Device ID : XXXXXXXXXXXX
SSLVPN:
 Current usage : 0
 High : 0
 Messages Tx/Rx/Error:
 Registration : 1 / 1 / 0
 Get : 0 / 0 / 0
 Release : 0 / 0 / 0
 Transfer : 0 / 0 / 0
```

...

# Feature History for Licensing

Table 3-14 lists each feature change and the platform release in which it was implemented.

**Table 3-14** Feature History for Licensing

| Feature Name                                                    | Platform Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Increased Connections and VLANs                                 | 7.0(5)            | Increased the following limits: <ul style="list-style-type: none"> <li>ASA5510 Base license connections from 32000 to 5000; VLANs from 0 to 10.</li> <li>ASA5510 Security Plus license connections from 64000 to 130000; VLANs from 10 to 25.</li> <li>ASA5520 connections from 130000 to 280000; VLANs from 25 to 100.</li> <li>ASA5540 connections from 280000 to 400000; VLANs from 100 to 200.</li> </ul>                                                                                                                                                                                                                                                                                                                                                       |
| SSL VPN Licenses                                                | 7.1(1)            | SSL VPN licenses were introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Increased SSL VPN Licenses                                      | 7.2(1)            | A 5000-user SSL VPN license was introduced for the ASA 5550 and above.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Increased interfaces for the Base license on the ASA 5510       | 7.2(2)            | For the Base license on the ASA 5510, the maximum number of interfaces was increased from 3 plus a management interface to unlimited interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Increased VLANs                                                 | 7.2(2)            | <p>The maximum number of VLANs for the Security Plus license on the ASA 5505 was increased from 5 (3 fully functional; 1 failover; one restricted to a backup interface) to 20 fully functional interfaces. In addition, the number of trunk ports was increased from 1 to 8. Now there are 20 fully functional interfaces, you do not need to use the backup interface command to cripple a backup ISP interface; you can use a fully-functional interface for it. The backup interface command is still useful for an Easy VPN configuration.</p> <p>VLAN limits were also increased for the ASA 5510 (from 10 to 50 for the Base license, and from 25 to 100 for the Security Plus license), the ASA 5520 (from 100 to 150), the ASA 5550 (from 200 to 250).</p> |
| Gigabit Ethernet Support for the ASA 5510 Security Plus License | 7.2(3)            | <p>The ASA 5510 now supports Gigabit Ethernet (1000 Mbps) for the Ethernet 0/0 and 0/1 ports with the Security Plus license. In the Base license, they continue to be used as Fast Ethernet (100 Mbps) ports. Ethernet 0/2, 0/3, and 0/4 remain as Fast Ethernet ports for both licenses.</p> <p><b>Note</b> The interface names remain Ethernet 0/0 and Ethernet 0/1.</p> <p>Use the <b>speed</b> command to change the speed on the interface and use the <b>show interface</b> command to see what speed is currently configured for each interface.</p>                                                                                                                                                                                                         |

**Table 3-14**      *Feature History for Licensing (continued)*

| Feature Name                                  | Platform Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Advanced Endpoint Assessment License          | 8.0(2)            | <p>The Advanced Endpoint Assessment license was introduced. As a condition for the completion of a Cisco AnyConnect or clientless SSL VPN connections, the remote computer scans for a greatly expanded collection of antivirus and antispymware applications, firewalls, operating systems, and associated updates. It also scans for any registry entries, filenames, and process names that you specify. It sends the scan results to the ASA. The ASA uses both the user login credentials and the computer scan results to assign a Dynamic Access Policy (DAP).</p> <p>With an Advanced Endpoint Assessment License, you can enhance Host Scan by configuring an attempt to update noncompliant computers to meet version requirements.</p> <p>Cisco can provide timely updates to the list of applications and versions that Host Scan supports in a package that is separate from Cisco Secure Desktop.</p> |
| VPN Load Balancing for the ASA 5510           | 8.0(2)            | VPN load balancing is now supported on the ASA 5510 Security Plus license.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| AnyConnect for Mobile License                 | 8.0(3)            | The AnyConnect for Mobile license was introduced. It lets Windows mobile devices connect to the ASA using the AnyConnect client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Time-based Licenses                           | 8.0(4)/8.1(2)     | Support for time-based licenses was introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Increased VLANs for the ASA 5580              | 8.1(2)            | The number of VLANs supported on the ASA 5580 are increased from 100 to 250.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Unified Communications Proxy Sessions license | 8.0(4)            | <p>The UC Proxy sessions license was introduced. Phone Proxy, Presence Federation Proxy, and Encrypted Voice Inspection applications use TLS proxy sessions for their connections. Each TLS proxy session is counted against the UC license limit. All of these applications are licensed under the UC Proxy umbrella, and can be mixed and matched.</p> <p>This feature is not available in Version 8.1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Botnet Traffic Filter License                 | 8.2(1)            | The Botnet Traffic Filter license was introduced. The Botnet Traffic Filter protects against malware network activity by tracking connections to known bad domains and IP addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 3-14 Feature History for Licensing (continued)

| Feature Name                                                                       | Platform Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------------------------------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AnyConnect Essentials License                                                      | 8.2(1)            | <p>The AnyConnect Essentials License was introduced. This license enables AnyConnect VPN client access to the ASA. This license does not support browser-based SSL VPN access or Cisco Secure Desktop. For these features, activate an AnyConnect Premium license instead of the AnyConnect Essentials license.</p> <p><b>Note</b> With the AnyConnect Essentials license, VPN users can use a Web browser to log in, and download and start (WebLaunch) the AnyConnect client.</p> <p>The AnyConnect client software offers the same set of client features, whether it is enabled by this license or an AnyConnect Premium license.</p> <p>The AnyConnect Essentials license cannot be active at the same time as the following licenses on a given ASA: AnyConnect Premium license (all types) or the Advanced Endpoint Assessment license. You can, however, run AnyConnect Essentials and AnyConnect Premium licenses on different ASAs in the same network.</p> <p>By default, the ASA uses the AnyConnect Essentials license, but you can disable it to use other licenses by using the <b>no anyconnect-essentials</b> command.</p> |
| SSL VPN license changed to AnyConnect Premium SSL VPN Edition license              | 8.2(1)            | The SSL VPN license name was changed to the AnyConnect Premium SSL VPN Edition license.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Shared Licenses for SSL VPN                                                        | 8.2(1)            | Shared licenses for SSL VPN were introduced. Multiple ASAs can share a pool of SSL VPN sessions on an as-needed basis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Mobility Proxy application no longer requires Unified Communications Proxy license | 8.2(2)            | The Mobility Proxy no longer requires the UC Proxy license.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 10 GE I/O license for the ASA 5585-X with SSP-20                                   | 8.2(3)            | <p>We introduced the 10 GE I/O license for the ASA 5585-X with SSP-20 to enable 10-Gigabit Ethernet speeds for the fiber ports. The SSP-60 supports 10-Gigabit Ethernet speeds by default.</p> <p><b>Note</b> The ASA 5585-X is not supported in 8.3(x).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 10 GE I/O license for the ASA 5585-X with SSP-10                                   | 8.2(4)            | <p>We introduced the 10 GE I/O license for the ASA 5585-X with SSP-10 to enable 10-Gigabit Ethernet speeds for the fiber ports. The SSP-40 supports 10-Gigabit Ethernet speeds by default.</p> <p><b>Note</b> The ASA 5585-X is not supported in 8.3(x).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 3-14 Feature History for Licensing (continued)

| Feature Name                                                                             | Platform Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------------------------------------------------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Non-identical failover licenses                                                          | 8.3(1)            | Failover licenses no longer need to be identical on each unit. The license used for both units is the combined license from the primary and secondary units.<br><br>We modified the following commands: <b>show activation-key</b> and <b>show version</b> .                                                                                                                                                                                                                                                                        |
| Stackable time-based licenses                                                            | 8.3(1)            | Time-based licenses are now stackable. In many cases, you might need to renew your time-based license and have a seamless transition from the old license to the new one. For features that are only available with a time-based license, it is especially important that the license not expire before you can apply the new license. The ASA allows you to <i>stack</i> time-based licenses so you do not have to worry about the license expiring or about losing time on your licenses because you installed the new one early. |
| Intercompany Media Engine License                                                        | 8.3(1)            | The IME license was introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Multiple time-based licenses active at the same time                                     | 8.3(1)            | You can now install multiple time-based licenses, and have one license per feature active at a time.<br><br>The following commands were modified: <b>show activation-key</b> and <b>show version</b> .                                                                                                                                                                                                                                                                                                                              |
| Discrete activation and deactivation of time-based licenses.                             | 8.3(1)            | You can now activate or deactivate time-based licenses using a command.<br><br>The following command was modified: <b>activation-key [activate   deactivate]</b> .                                                                                                                                                                                                                                                                                                                                                                  |
| AnyConnect Premium SSL VPN Edition license changed to AnyConnect Premium SSL VPN license | 8.3(1)            | The AnyConnect Premium SSL VPN Edition license name was changed to the AnyConnect Premium SSL VPN license.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| No Payload Encryption image for export                                                   | 8.3(2)            | If you install the No Payload Encryption software on the ASA 5505 through 5550, then you disable Unified Communications, strong encryption VPN, and strong encryption management protocols.<br><br><b>Note</b> This special image is only supported in 8.3(x); for No Payload Encryption support in 8.4(1) and later, you need to purchase a special hardware version of the ASA.                                                                                                                                                   |
| Increased contexts for the ASA 5550, 5580, and 5585-X                                    | 8.4(1)            | For the ASA 5550 and ASA 5585-X with SSP-10, the maximum contexts was increased from 50 to 100. For the ASA 5580 and 5585-X with SSP-20 and higher, the maximum was increased from 50 to 250.                                                                                                                                                                                                                                                                                                                                       |
| Increased VLANs for the ASA 5580 and 5585-X                                              | 8.4(1)            | For the ASA 5580 and 5585-X, the maximum VLANs was increased from 250 to 1024.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 3-14**      *Feature History for Licensing (continued)*

| Feature Name                                                             | Platform Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------------------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Increased connections for the ASA 5580 and 5585-X                        | 8.4(1)            | <p>We increased the firewall connection limits:</p> <ul style="list-style-type: none"> <li>• ASA 5580-20—1,000,000 to 2,000,000.</li> <li>• ASA 5580-40—2,000,000 to 4,000,000.</li> <li>• ASA 5585-X with SSP-10: 750,000 to 1,000,000.</li> <li>• ASA 5585-X with SSP-20: 1,000,000 to 2,000,000.</li> <li>• ASA 5585-X with SSP-40: 2,000,000 to 4,000,000.</li> <li>• ASA 5585-X with SSP-60: 2,000,000 to 10,000,000.</li> </ul> |
| AnyConnect Premium SSL VPN license changed to AnyConnect Premium license | 8.4(1)            | The AnyConnect Premium SSL VPN license name was changed to the AnyConnect Premium license. The license information display was changed from “SSL VPN Peers” to “AnyConnect Premium Peers.”                                                                                                                                                                                                                                            |
| Increased AnyConnect VPN sessions for the ASA 5580                       | 8.4(1)            | The AnyConnect VPN session limit was increased from 5,000 to 10,000.                                                                                                                                                                                                                                                                                                                                                                  |
| Increased Other VPN sessions for the ASA 5580                            | 8.4(1)            | The other VPN session limit was increased from 5,000 to 10,000.                                                                                                                                                                                                                                                                                                                                                                       |
| IPsec remote access VPN using IKEv2                                      | 8.4(1)            | <p>IPsec remote access VPN using IKEv2 was added to the AnyConnect Essentials and AnyConnect Premium licenses.</p> <p>IKEv2 site-to-site sessions were added to the Other VPN license (formerly IPsec VPN). The Other VPN license is included in the Base license.</p>                                                                                                                                                                |
| No Payload Encryption hardware for export                                | 8.4(1)            | For models available with No Payload Encryption (for example, the ASA 5585-X), the ASA software disables Unified Communications and VPN features, making the ASA available for export to certain countries.                                                                                                                                                                                                                           |
| Dual SSPs for SSP-20 and SSP-40                                          | 8.4(2)            | For SSP-40 and SSP-60, you can use two SSPs of the same level in the same chassis. Mixed-level SSPs are not supported (for example, an SSP-40 with an SSP-60 is not supported). Each SSP acts as an independent device, with separate configurations and management. You can use the two SSPs as a failover pair if desired. When using two SSPs in the chassis, VPN is not supported; note, however, that VPN has not been disabled. |

## **PART 2**

### **Configuring Firewall and Security Context Modes**

## CHAPTER 4

# Configuring the Transparent or Routed Firewall

---

This chapter describes how to set the firewall mode to routed or transparent, as well as how the firewall works in each firewall mode.

In multiple context mode, you cannot set the firewall mode separately for each context; you can only set the firewall mode for the entire ASA.

This chapter includes the following sections:

- [Configuring the Firewall Mode, page 4-1](#)
- [Configuring ARP Inspection for the Transparent Firewall, page 4-9](#)
- [Customizing the MAC Address Table for the Transparent Firewall, page 4-13](#)
- [Firewall Mode Examples, page 4-16](#)

## Configuring the Firewall Mode

This section describes routed and transparent firewall mode, and how to set the mode. This section includes the following topics:

- [Information About the Firewall Mode, page 4-1](#)
- [Licensing Requirements for the Firewall Mode, page 4-6](#)
- [Default Settings, page 4-6](#)
- [Guidelines and Limitations, page 4-6](#)
- [Setting the Firewall Mode, page 4-8](#)
- [Feature History for Firewall Mode, page 4-9](#)

## Information About the Firewall Mode

This section describes routed and transparent firewall mode and includes the following topics:

- [Information About Routed Firewall Mode, page 4-2](#)
- [Information About Transparent Firewall Mode, page 4-2](#)

## Information About Routed Firewall Mode

In routed mode, the ASA is considered to be a router hop in the network. It can use OSPF or RIP (in single context mode). Routed mode supports many interfaces. Each interface is on a different subnet. You can share interfaces between contexts.

The ASA acts as a router between connected networks, and each interface requires an IP address on a different subnet. In single context mode, the routed firewall supports OSPF, EIGRP, and RIP. Multiple context mode supports static routes only. We recommend using the advanced routing capabilities of the upstream and downstream routers instead of relying on the ASA for extensive routing needs.

## Information About Transparent Firewall Mode

Traditionally, a firewall is a routed hop and acts as a default gateway for hosts that connect to one of its screened subnets. A transparent firewall, on the other hand, is a Layer 2 firewall that acts like a “bump in the wire,” or a “stealth firewall,” and is not seen as a router hop to connected devices.

This section describes transparent firewall mode and includes the following topics:

- [Transparent Firewall Network, page 4-2](#)
- [Bridge Groups, page 4-2](#)
- [Management Interface \(ASA 5510 and Higher\), page 4-3](#)
- [Allowing Layer 3 Traffic, page 4-3](#)
- [Allowed MAC Addresses, page 4-3](#)
- [Passing Traffic Not Allowed in Routed Mode, page 4-3](#)
- [BPDU Handling, page 4-4](#)
- [MAC Address vs. Route Lookups, page 4-4](#)
- [Using the Transparent Firewall in Your Network, page 4-5](#)

### Transparent Firewall Network

The ASA connects the same network between its interfaces. Because the firewall is not a routed hop, you can easily introduce a transparent firewall into an existing network.

### Bridge Groups

If you do not want the overhead of security contexts, or want to maximize your use of security contexts, you can group interfaces together in a bridge group, and then configure multiple bridge groups, one for each network. Bridge group traffic is isolated from other bridge groups; traffic is not routed to another bridge group within the ASA, and traffic must exit the ASA before it is routed by an external router back to another bridge group in the ASA. Although the bridging functions are separate for each bridge group, many other functions are shared between all bridge groups. For example, all bridge groups share a syslog server or AAA server configuration. For complete security policy separation, use security contexts with one bridge group in each context.

**Note**

Each bridge group requires a management IP address. The ASA uses this IP address as the source address for packets originating from the bridge group. The management IP address must be on the same subnet as the connected network. For another method of management, see the [“Management Interface \(ASA 5510 and Higher\)”](#) section on page 4-3.

The ASA does not support traffic on secondary networks; only traffic on the same network as the management IP address is supported.

### Management Interface (ASA 5510 and Higher)

In addition to each bridge group management IP address, you can add a separate Management *slot/port* interface that is not part of any bridge group, and that allows only management traffic to the ASA. For more information, see the [“Management Interface” section on page 6-2](#).

### Allowing Layer 3 Traffic

- IPv4 and IPv6 traffic is allowed through the transparent firewall automatically from a higher security interface to a lower security interface, without an access list.
- ARPs are allowed through the transparent firewall in both directions without an access list. ARP traffic can be controlled by ARP inspection.
- For Layer 3 traffic travelling from a low to a high security interface, an extended access list is required on the low security interface. See [Chapter 15, “Adding an Extended Access List,”](#) or [Chapter 19, “Adding an IPv6 Access List,”](#) for more information.

### Allowed MAC Addresses

The following destination MAC addresses are allowed through the transparent firewall. Any MAC address not on this list is dropped.

- TRUE broadcast destination MAC address equal to FFFF.FFFF.FFFF
- IPv4 multicast MAC addresses from 0100.5E00.0000 to 0100.5EFE.FFFF
- IPv6 multicast MAC addresses from 3333.0000.0000 to 3333.FFFF.FFFF
- BPDU multicast address equal to 0100.0CCC.CCCD
- AppleTalk multicast MAC addresses from 0900.0700.0000 to 0900.07FF.FFFF

### Passing Traffic Not Allowed in Routed Mode

In routed mode, some types of traffic cannot pass through the ASA even if you allow it in an access list. The transparent firewall, however, can allow almost any traffic through using either an extended access list (for IP traffic) or an EtherType access list (for non-IP traffic).

Non-IP traffic (for example AppleTalk, IPX, BPDUs, and MPLS) can be configured to go through using an EtherType access list.

#### Note

The transparent mode ASA does not pass CDP packets, or any packets that do not have a valid EtherType greater than or equal to 0x600. For example, you cannot pass IS-IS packets. An exception is made for BPDUs, which are supported.

### Passing Traffic For Routed-Mode Features

For features that are not directly supported on the transparent firewall, you can allow traffic to pass through so that upstream and downstream routers can support the functionality. For example, by using an extended access list, you can allow DHCP traffic (instead of the unsupported DHCP relay feature) or

multicast traffic such as that created by IP/TV. You can also establish routing protocol adjacencies through a transparent firewall; you can allow OSPF, RIP, EIGRP, or BGP traffic through based on an extended access list. Likewise, protocols like HSRP or VRRP can pass through the ASA.

## BPDU Handling

To prevent loops using the Spanning Tree Protocol, BPDUs are passed by default. To block BPDUs, you need to configure an EtherType access list to deny them. If you are using failover, you might want to block BPDUs to prevent the switch port from going into a blocking state when the topology changes. See the [“Transparent Firewall Mode Requirements” section on page 60-12](#) for more information.

## MAC Address vs. Route Lookups

When the ASA runs in transparent mode, the outgoing interface of a packet is determined by performing a MAC address lookup instead of a route lookup.

Route lookups, however, are necessary for the following traffic types:

- Traffic originating on the ASA—For example, if your syslog server is located on a remote network, you must use a static route so the ASA can reach that subnet.
- Traffic that is at least one hop away from the ASA with NAT enabled—The ASA needs to perform a route lookup; you need to add a static route on the ASA for the real host address.
- Voice over IP (VoIP) traffic with inspection enabled, and the endpoint is at least one hop away from the ASA—For example, if you use the transparent firewall between a CCM and an H.323 gateway, and there is a router between the transparent firewall and the H.323 gateway, then you need to add a static route on the ASA for the H.323 gateway for successful call completion.
- VoIP or DNS traffic with inspection enabled, with NAT enabled, and the embedded address is at least one hop away from the ASA—To successfully translate the IP address inside VoIP and DNS packets, the ASA needs to perform a route lookup; you need to add a static route on the ASA for the real host address that is embedded in the packet.

## Using the Transparent Firewall in Your Network

Figure 4-1 shows a typical transparent firewall network where the outside devices are on the same subnet as the inside devices. The inside router and hosts appear to be directly connected to the outside router.

**Figure 4-1** Transparent Firewall Network

92411

Figure 4-2 shows two networks connected to the ASA, which has two bridge groups.

**Figure 4-2**      *Transparent Firewall Network with Two Bridge Groups*

## Licensing Requirements for the Firewall Mode

The following table shows the licensing requirements for this feature.

| Model      | License Requirement |
|------------|---------------------|
| All models | Base License.       |

## Default Settings

The default mode is routed mode.

## Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

### Context Mode Guidelines

- For the ASA 5500 series appliances, the firewall mode is set for the entire system and all contexts; you cannot set the mode individually for each context.

- When you change modes, the ASA clears the running configuration because many commands are not supported for both modes. This action removes any contexts from running. If you then re-add a context that has an existing configuration that was created for the wrong mode, the context configuration might not work correctly. Be sure to recreate your context configurations for the correct mode before you re-add them, or add new contexts with new paths for the new configurations.

### Transparent Firewall Guidelines

Follow these guidelines when planning your transparent firewall network:

- In transparent firewall mode, the management interface updates the MAC address table in the same manner as a data interface; therefore you should not connect both a management and a data interface to the same switch unless you configure one of the switch ports as a routed port (by default Cisco Catalyst switches share a MAC address for all VLAN switch ports). Otherwise, if traffic arrives on the management interface from the physically-connected switch, then the ASA updates the MAC address table to use the *management* interface to access the switch, instead of the data interface. This action causes a temporary traffic interruption; the ASA will not re-update the MAC address table for packets from the switch to the data interface for at least 30 seconds for security reasons.
- Each directly-connected network must be on the same subnet.
- Do not specify the bridge group management IP address as the default gateway for connected devices; devices need to specify the router on the other side of the ASA as the default gateway.
- The default route for the transparent firewall, which is required to provide a return path for management traffic, is only applied to management traffic from one bridge group network. This is because the default route specifies an interface in the bridge group as well as the router IP address on the bridge group network, and you can only define one default route. If you have management traffic from more than one bridge group network, you need to specify a static route that identifies the network from which you expect management traffic.

See the [“Guidelines and Limitations” section on page 9-4](#) for more guidelines.

### IPv6 Guidelines

Supports IPv6.

### Additional Guidelines and Limitations

- When you change firewall modes, the ASA clears the running configuration because many commands are not supported for both modes. The startup configuration remains unchanged. If you reload without saving, then the startup configuration is loaded, and the mode reverts back to the original setting. See the [“Setting the Firewall Mode” section on page 4-8](#) for information about backing up your configuration file.
- If you download a text configuration to the ASA that changes the mode with the **firewall transparent** command, be sure to put the command at the top of the configuration; the ASA changes the mode as soon as it reads the command and then continues reading the configuration you downloaded. If the command appears later in the configuration, the ASA clears all the preceding lines in the configuration. See the [“Downloading Software or Configuration Files to Flash Memory” section on page 80-2](#) for information about downloading text files.

### Unsupported Features in Transparent Mode

[Table 4-1](#) lists the features are not supported in transparent mode.

**Table 4-1**      *Unsupported Features in Transparent Mode*

| Feature                             | Description                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dynamic DNS                         | —                                                                                                                                                                                                                                                                                                                                                                  |
| DHCP relay                          | The transparent firewall can act as a DHCP server, but it does not support the DHCP relay commands. DHCP relay is not required because you can allow DHCP traffic to pass through using two extended access lists: one that allows DHCP requests from the inside interface to the outside, and one that allows the replies from the server in the other direction. |
| Dynamic routing protocols           | You can, however, add static routes for traffic originating on the ASA. You can also allow dynamic routing protocols through the ASA using an extended access list.                                                                                                                                                                                                |
| Multicast IP routing                | You can allow multicast traffic through the ASA by allowing it in an extended access list.                                                                                                                                                                                                                                                                         |
| QoS                                 | —                                                                                                                                                                                                                                                                                                                                                                  |
| VPN termination for through traffic | The transparent firewall supports site-to-site VPN tunnels for management connections only. It does not terminate VPN connections for traffic through the ASA. You can pass VPN traffic through the ASA using an extended access list, but it does not terminate non-management connections. SSL VPN is also not supported.                                        |

## Setting the Firewall Mode

This section describes how to change the firewall mode.

### Note

We recommend that you set the firewall mode before you perform any other configuration because changing the firewall mode clears the running configuration.

### Prerequisites

When you change modes, the ASA clears the running configuration (see the [“Guidelines and Limitations”](#) section on page 4-6 for more information).

- If you already have a populated configuration, be sure to back up your configuration before changing the mode; you can use this backup for reference when creating your new configuration. See the [“Backing Up Configuration Files or Other Files”](#) section on page 80-7.
- Use the CLI at the console port to change the mode. If you use any other type of session, including the ASDM Command Line Interface tool or SSH, you will be disconnected when the configuration is cleared, and you will have to reconnect to the ASA using the console port in any case.
- For the ASA 5500 series appliances, set the mode for the whole system in the system execution space.

## Detailed Steps

| Command                                                   | Purpose                                                                                                                |
|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>firewall transparent</b>                               | Sets the firewall mode to transparent. To change the mode to routed, enter the <b>no firewall transparent</b> command. |
| <b>Example:</b><br>hostname(config)# firewall transparent | <b>Note</b> You are not prompted to confirm the firewall mode change; the change occurs immediately.                   |

## Feature History for Firewall Mode

Table 4-2 lists the release history for this feature.

**Table 4-2** Feature History for Firewall Mode

| Feature Name                       | Releases | Feature Information                                                                                                                                                                                                                                                                                                 |
|------------------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transparent firewall mode          | 7.0(1)   | A transparent firewall is a Layer 2 firewall that acts like a “bump in the wire,” or a “stealth firewall,” and is not seen as a router hop to connected devices.<br><br>We introduced the following commands: <b>firewall transparent</b> , <b>show firewall</b> .                                                  |
| Transparent firewall bridge groups | 8.4(1)   | Multiple bridge groups are now allowed in transparent firewall mode. Also, you can now configure up to four interfaces (per bridge group); formerly, you could only configure two interfaces in transparent mode.<br><br>We introduced the following commands: <b>firewall transparent</b> , <b>show firewall</b> . |

## Configuring ARP Inspection for the Transparent Firewall

This section describes ARP inspection and how to enable it and includes the following topics:

- [Information About ARP Inspection, page 4-10](#)
- [Licensing Requirements for ARP Inspection, page 4-10](#)
- [Default Settings, page 4-10](#)
- [Guidelines and Limitations, page 4-10](#)
- [Configuring ARP Inspection, page 4-11](#)
- [Monitoring ARP Inspection, page 4-12](#)
- [Feature History for ARP Inspection, page 4-13](#)

## Information About ARP Inspection

By default, all ARP packets are allowed through the ASA. You can control the flow of ARP packets by enabling ARP inspection.

When you enable ARP inspection, the ASA compares the MAC address, IP address, and source interface in all ARP packets to static entries in the ARP table, and takes the following actions:

- If the IP address, MAC address, and source interface match an ARP entry, the packet is passed through.
- If there is a mismatch between the MAC address, the IP address, or the interface, then the ASA drops the packet.
- If the ARP packet does not match any entries in the static ARP table, then you can set the ASA to either forward the packet out all interfaces (flood), or to drop the packet.

### Note

The dedicated management interface, if present, never floods packets even if this parameter is set to flood.

ARP inspection prevents malicious users from impersonating other hosts or routers (known as ARP spoofing). ARP spoofing can enable a “man-in-the-middle” attack. For example, a host sends an ARP request to the gateway router; the gateway router responds with the gateway router MAC address. The attacker, however, sends another ARP response to the host with the attacker MAC address instead of the router MAC address. The attacker can now intercept all the host traffic before forwarding it on to the router.

ARP inspection ensures that an attacker cannot send an ARP response with the attacker MAC address, so long as the correct MAC address and the associated IP address are in the static ARP table.

## Licensing Requirements for ARP Inspection

The following table shows the licensing requirements for this feature.

| Model      | License Requirement |
|------------|---------------------|
| All models | Base License.       |

## Default Settings

By default, all ARP packets are allowed through the ASA.

If you enable ARP inspection, the default setting is to flood non-matching packets.

## Guidelines and Limitations

### Context Mode Guidelines

- Supported in single and multiple context mode.
- In multiple context mode, configure ARP inspection within each context.

### Firewall Mode Guidelines

Supported only in transparent firewall mode. Routed mode is not supported.

## Configuring ARP Inspection

This section describes how to configure ARP inspection and includes the following topics:

- [Task Flow for Configuring ARP Inspection, page 4-11](#)
- [Adding a Static ARP Entry, page 4-11](#)
- [Enabling ARP Inspection, page 4-12](#)

### Task Flow for Configuring ARP Inspection

To configure ARP Inspection, perform the following steps:

- |               |                                                                                                                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | Add static ARP entries according to the “ <a href="#">Adding a Static ARP Entry</a> ” section on page 4-11. ARP inspection compares ARP packets with static ARP entries in the ARP table, so static ARP entries are required for this feature. |
| <b>Step 2</b> | Enable ARP inspection according to the “ <a href="#">Enabling ARP Inspection</a> ” section on page 4-12.                                                                                                                                       |

### Adding a Static ARP Entry

ARP inspection compares ARP packets with static ARP entries in the ARP table. Although hosts identify a packet destination by an IP address, the actual delivery of the packet on Ethernet relies on the Ethernet MAC address. When a router or host wants to deliver a packet on a directly connected network, it sends an ARP request asking for the MAC address associated with the IP address, and then delivers the packet to the MAC address according to the ARP response. The host or router keeps an ARP table so it does not have to send ARP requests for every packet it needs to deliver. The ARP table is dynamically updated whenever ARP responses are sent on the network, and if an entry is not used for a period of time, it times out. If an entry is incorrect (for example, the MAC address changes for a given IP address), the entry times out before it can be updated.

**Note**

The transparent firewall uses dynamic ARP entries in the ARP table for traffic to and from the ASA, such as management traffic.

### Detailed Steps

| Command                                                                     | Purpose                  |
|-----------------------------------------------------------------------------|--------------------------|
| <code>arp interface_name ip_address mac_address</code>                      | Adds a static ARP entry. |
| <b>Example:</b><br>hostname(config)# arp outside 10.1.1.1<br>0009.7cbe.2100 |                          |

Examples

For example, to allow ARP responses from the router at 10.1.1.1 with the MAC address 0009.7cbe.2100 on the outside interface, enter the following command:

```
hostname(config)# arp outside 10.1.1.1 0009.7cbe.2100
```

What to Do Next

Enable ARP inspection according to the [“Enabling ARP Inspection” section on page 4-12](#).

Enabling ARP Inspection

This section describes how to enable ARP inspection.

Detailed Steps

| Command                                                                                  | Purpose                                                                                                                                                              |
|------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>arp-inspection interface_name enable</code><br><code>[flood   no-flood]</code>     | Enables ARP inspection.<br><br>The <b>flood</b> keyword forwards non-matching ARP packets out all interfaces, and <b>no-flood</b> drops non-matching packets.        |
| <b>Example:</b><br><code>hostname(config)# arp-inspection outside enable no-flood</code> | <b>Note</b> The default setting is to flood non-matching packets. To restrict ARP through the ASA to only static entries, then set this command to <b>no-flood</b> . |

Examples

For example, to enable ARP inspection on the outside interface, and to drop all non-matching ARP packets, enter the following command:

```
hostname(config)# arp-inspection outside enable no-flood
```

Monitoring ARP Inspection

To monitor ARP inspection, perform the following task:

| Command                          | Purpose                                                          |
|----------------------------------|------------------------------------------------------------------|
| <code>show arp-inspection</code> | Shows the current settings for ARP inspection on all interfaces. |

## Feature History for ARP Inspection

Table 4-2 lists the release history for this feature.

**Table 4-3**      *Feature History for ARP Inspection*

| Feature Name   | Releases | Feature Information                                                                                                                                                                                                                                 |
|----------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ARP inspection | 7.0(1)   | ARP inspection compares the MAC address, IP address, and source interface in all ARP packets to static entries in the ARP table.<br><br>We introduced the following commands: <b>arp</b> , <b>arp-inspection</b> , and <b>show arp-inspection</b> . |

## Customizing the MAC Address Table for the Transparent Firewall

This section describes the MAC address table and includes the following topics:

- [Information About the MAC Address Table, page 4-13](#)
- [Licensing Requirements for the MAC Address Table, page 4-14](#)
- [Default Settings, page 4-14](#)
- [Guidelines and Limitations, page 4-14](#)
- [Configuring the MAC Address Table, page 4-14](#)
- [Monitoring the MAC Address Table, page 4-16](#)
- [Feature History for the MAC Address Table, page 4-16](#)

### Information About the MAC Address Table

The ASA learns and builds a MAC address table in a similar way as a normal bridge or switch: when a device sends a packet through the ASA, the ASA adds the MAC address to its table. The table associates the MAC address with the source interface so that the ASA knows to send any packets addressed to the device out the correct interface.

The ASA 5505 includes a built-in switch; the switch MAC address table maintains the MAC address-to-switch port mapping for traffic within each VLAN. This section only discusses the *bridge* MAC address table, which maintains the MAC address-to-VLAN interface mapping for traffic that passes between VLANs.

Because the ASA is a firewall, if the destination MAC address of a packet is not in the table, the ASA does not flood the original packet on all interfaces as a normal bridge does. Instead, it generates the following packets for directly connected devices or for remote devices:

- Packets for directly connected devices—The ASA generates an ARP request for the destination IP address, so that the ASA can learn which interface receives the ARP response.
- Packets for remote devices—The ASA generates a ping to the destination IP address so that the ASA can learn which interface receives the ping reply.

The original packet is dropped.

## Licensing Requirements for the MAC Address Table

The following table shows the licensing requirements for this feature.

| Model      | License Requirement |
|------------|---------------------|
| All models | Base License.       |

## Default Settings

The default timeout value for dynamic MAC address table entries is 5 minutes.

By default, each interface automatically learns the MAC addresses of entering traffic, and the ASA adds corresponding entries to the MAC address table.

## Guidelines and Limitations

### Context Mode Guidelines

- Supported in single and multiple context mode.
- In multiple context mode, configure the MAC address table within each context.

### Firewall Mode Guidelines

Supported only in transparent firewall mode. Routed mode is not supported.

### Additional Guidelines

In transparent firewall mode, the management interface updates the MAC address table in the same manner as a data interface; therefore you should not connect both a management and a data interface to the same switch unless you configure one of the switch ports as a routed port (by default Cisco Catalyst switches share a MAC address for all VLAN switch ports). Otherwise, if traffic arrives on the management interface from the physically-connected switch, then the ASA updates the MAC address table to use the *management* interface to access the switch, instead of the data interface. This action causes a temporary traffic interruption; the ASA will not re-update the MAC address table for packets from the switch to the data interface for at least 30 seconds for security reasons.

## Configuring the MAC Address Table

This section describes how you can customize the MAC address table and includes the following sections:

- [Adding a Static MAC Address, page 4-15](#)
- [Setting the MAC Address Timeout, page 4-15](#)
- [Disabling MAC Address Learning, page 4-15](#)

## Adding a Static MAC Address

Normally, MAC addresses are added to the MAC address table dynamically as traffic from a particular MAC address enters an interface. You can add static MAC addresses to the MAC address table if desired. One benefit to adding static entries is to guard against MAC spoofing. If a client with the same MAC address as a static entry attempts to send traffic to an interface that does not match the static entry, then the ASA drops the traffic and generates a system message. When you add a static ARP entry (see the “[Adding a Static ARP Entry](#)” section on page 4-11), a static MAC address entry is automatically added to the MAC address table.

To add a static MAC address to the MAC address table, enter the following command:

| Command                                                                                | Purpose                                                                                    |
|----------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| <b>mac-address-table static</b> <i>interface_name</i> <i>mac_address</i>               | Adds a static MAC address entry.<br><br>The <i>interface_name</i> is the source interface. |
| <b>Example:</b><br>hostname(config)# mac-address-table static<br>inside 0009.7cbe.2100 |                                                                                            |

## Setting the MAC Address Timeout

The default timeout value for dynamic MAC address table entries is 5 minutes, but you can change the timeout. To change the timeout, enter the following command:

| Command                                                                 | Purpose                                                                                                                                     |
|-------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mac-address-table aging-time</b> <i>timeout_value</i>                | Sets the MAC address entry timeout.<br><br>The <i>timeout_value</i> (in minutes) is between 5 and 720 (12 hours). 5 minutes is the default. |
| <b>Example:</b><br>hostname(config)# mac-address-table<br>aging-time 10 |                                                                                                                                             |

## Disabling MAC Address Learning

By default, each interface automatically learns the MAC addresses of entering traffic, and the ASA adds corresponding entries to the MAC address table. You can disable MAC address learning if desired, however, unless you statically add MAC addresses to the table, no traffic can pass through the ASA.

To disable MAC address learning, enter the following command:

| Command                                                       | Purpose                                                                                                                                                                                                 |
|---------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mac-learn</b> <i>interface_name</i> <b>disable</b>         | Disables MAC address learning.<br><br>The <b>no</b> form of this command reenables MAC address learning. The <b>clear configure mac-learn</b> command reenables MAC address learning on all interfaces. |
| <b>Example:</b><br>hostname(config)# mac-learn inside disable |                                                                                                                                                                                                         |

## Monitoring the MAC Address Table

You can view the entire MAC address table (including static and dynamic entries for both interfaces), or you can view the MAC address table for an interface. To view the MAC address table, enter the following command:

| Command                                              | Purpose                      |
|------------------------------------------------------|------------------------------|
| <code>show mac-address-table [interface_name]</code> | Shows the MAC address table. |

### Examples

The following is sample output from the **show mac-address-table** command that shows the entire table:

```
hostname# show mac-address-table
interface mac address type Time Left

outside 0009.7cbe.2100 static -
inside 0010.7cbe.6101 static -
inside 0009.7cbe.5101 dynamic 10
```

The following is sample output from the **show mac-address-table** command that shows the table for the inside interface:

```
hostname# show mac-address-table inside
interface mac address type Time Left

inside 0010.7cbe.6101 static -
inside 0009.7cbe.5101 dynamic 10
```

## Feature History for the MAC Address Table

Table 4-2 lists the release history for this feature.

**Table 4-4** Feature History for the MAC Address Table

| Feature Name      | Releases | Feature Information                                                                                                                                                                                                                       |
|-------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAC address table | 7.0(1)   | Transparent firewall mode uses a MAC address table.<br>We introduced the following commands:<br><b>mac-address-table static</b> , <b>mac-address-table aging-time</b> ,<br><b>mac-learn disable</b> , and <b>show mac-address-table</b> . |

## Firewall Mode Examples

This section includes examples of how traffic moves through the ASA and includes the following topics:

- [How Data Moves Through the ASA in Routed Firewall Mode, page 4-17](#)
- [How Data Moves Through the Transparent Firewall, page 4-22](#)

## How Data Moves Through the ASA in Routed Firewall Mode

This section describes how data moves through the ASA in routed firewall mode and includes the following topics:

- [An Inside User Visits a Web Server, page 4-17](#)
- [An Outside User Visits a Web Server on the DMZ, page 4-18](#)
- [An Inside User Visits a Web Server on the DMZ, page 4-19](#)
- [An Outside User Attempts to Access an Inside Host, page 4-20](#)
- [A DMZ User Attempts to Access an Inside Host, page 4-21](#)

### An Inside User Visits a Web Server

Figure 4-3 shows an inside user accessing an outside web server.

**Figure 4-3**      *Inside to Outside*

The following steps describe how data moves through the ASA (see Figure 4-3):

1. The user on the inside network requests a web page from www.example.com.
2. The ASA receives the packet and because it is a new session, the ASA verifies that the packet is allowed according to the terms of the security policy (access lists, filters, AAA).

For multiple context mode, the ASA first classifies the packet according to either a unique interface or a unique destination address associated with a context; the destination address is associated by matching an address translation in a context. In this case, the interface would be unique; the `www.example.com` IP address does not have a current address translation in a context.

3. The ASA translates the local source address (10.1.2.27) to the global address 209.165.201.10, which is on the outside interface subnet.

The global address could be on any subnet, but routing is simplified when it is on the outside interface subnet.

4. The ASA then records that a session is established and forwards the packet from the outside interface.
5. When `www.example.com` responds to the request, the packet goes through the ASA, and because the session is already established, the packet bypasses the many lookups associated with a new connection. The ASA performs NAT by translating the global destination address to the local user address, 10.1.2.27.
6. The ASA forwards the packet to the inside user.

## An Outside User Visits a Web Server on the DMZ

Figure 4-4 shows an outside user accessing the DMZ web server.

92406

The following steps describe how data moves through the ASA (see [Figure 4-4](#)):

1. A user on the outside network requests a web page from the DMZ web server using the global destination address of 209.165.201.3, which is on the outside interface subnet.
2. The ASA receives the packet and because it is a new session, the ASA verifies that the packet is allowed according to the terms of the security policy (access lists, filters, AAA).  
For multiple context mode, the ASA first classifies the packet according to either a unique interface or a unique destination address associated with a context; the destination address is associated by matching an address translation in a context. In this case, the classifier “knows” that the DMZ web server address belongs to a certain context because of the server address translation.
3. The ASA translates the destination address to the local address 10.1.1.3.
4. The ASA then adds a session entry to the fast path and forwards the packet from the DMZ interface.
5. When the DMZ web server responds to the request, the packet goes through the ASA and because the session is already established, the packet bypasses the many lookups associated with a new connection. The ASA performs NAT by translating the local source address to 209.165.201.3.
6. The ASA forwards the packet to the outside user.

## An Inside User Visits a Web Server on the DMZ

[Figure 4-5](#) shows an inside user accessing the DMZ web server.

The following steps describe how data moves through the ASA (see [Figure 4-5](#)):

1. A user on the inside network requests a web page from the DMZ web server using the destination address of 10.1.1.3.
2. The ASA receives the packet and because it is a new session, the ASA verifies that the packet is allowed according to the terms of the security policy (access lists, filters, AAA).

For multiple context mode, the ASA first classifies the packet according to either a unique interface or a unique destination address associated with a context; the destination address is associated by matching an address translation in a context. In this case, the interface is unique; the web server IP address does not have a current address translation.

3. The ASA then records that a session is established and forwards the packet out of the DMZ interface.
4. When the DMZ web server responds to the request, the packet goes through the fast path, which lets the packet bypass the many lookups associated with a new connection.
5. The ASA forwards the packet to the inside user.

## An Outside User Attempts to Access an Inside Host

[Figure 4-6](#) shows an outside user attempting to access the inside network.

The following steps describe how data moves through the ASA (see [Figure 4-6](#)):

1. A user on the outside network attempts to reach an inside host (assuming the host has a routable IP address).

If the inside network uses private addresses, no outside user can reach the inside network without NAT. The outside user might attempt to reach an inside user by using an existing NAT session.

2. The ASA receives the packet and because it is a new session, the ASA verifies if the packet is allowed according to the security policy (access lists, filters, AAA).
3. The packet is denied, and the ASA drops the packet and logs the connection attempt.

If the outside user is attempting to attack the inside network, the ASA employs many technologies to determine if a packet is valid for an already established session.

## A DMZ User Attempts to Access an Inside Host

Figure 4-7 shows a user in the DMZ attempting to access the inside network.

**Figure 4-7** DMZ to Inside

The following steps describe how data moves through the ASA (see Figure 4-7):

1. A user on the DMZ network attempts to reach an inside host. Because the DMZ does not have to route the traffic on the Internet, the private addressing scheme does not prevent routing.
2. The ASA receives the packet and because it is a new session, the ASA verifies if the packet is allowed according to the security policy (access lists, filters, AAA).

The packet is denied, and the ASA drops the packet and logs the connection attempt.

## How Data Moves Through the Transparent Firewall

Figure 4-8 shows a typical transparent firewall implementation with an inside network that contains a public web server. The ASA has an access list so that the inside users can access Internet resources. Another access list lets the outside users access only the web server on the inside network.

**Figure 4-8** Typical Transparent Firewall Data Path

This section describes how data moves through the ASA and includes the following topics:

- [An Inside User Visits a Web Server, page 4-23](#)
- [An Inside User Visits a Web Server Using NAT, page 4-24](#)
- [An Outside User Visits a Web Server on the Inside Network, page 4-25](#)
- [An Outside User Attempts to Access an Inside Host, page 4-26](#)

## An Inside User Visits a Web Server

Figure 4-9 shows an inside user accessing an outside web server.

**Figure 4-9** *Inside to Outside*

The following steps describe how data moves through the ASA (see Figure 4-9):

1. The user on the inside network requests a web page from www.example.com.
2. The ASA receives the packet and adds the source MAC address to the MAC address table, if required. Because it is a new session, it verifies that the packet is allowed according to the terms of the security policy (access lists, filters, AAA).

For multiple context mode, the ASA first classifies the packet according to a unique interface.

3. The ASA records that a session is established.
4. If the destination MAC address is in its table, the ASA forwards the packet out of the outside interface. The destination MAC address is that of the upstream router, 209.165.201.2.

If the destination MAC address is not in the ASA table, the ASA attempts to discover the MAC address by sending an ARP request or a ping. The first packet is dropped.

5. The web server responds to the request; because the session is already established, the packet bypasses the many lookups associated with a new connection.
6. The ASA forwards the packet to the inside user.

## An Inside User Visits a Web Server Using NAT

Figure 4-10 shows an inside user accessing an outside web server.

**Figure 4-10**      *Inside to Outside with NAT*

The following steps describe how data moves through the ASA (see Figure 4-10):

1. The user on the inside network requests a web page from `www.example.com`.
2. The ASA receives the packet and adds the source MAC address to the MAC address table, if required. Because it is a new session, it verifies that the packet is allowed according to the terms of the security policy (access lists, filters, AAA).

For multiple context mode, the ASA first classifies the packet according to a unique interface.

3. The ASA translates the real address (10.1.2.27) to the mapped address 209.165.201.10.  
Because the mapped address is not on the same network as the outside interface, then be sure the upstream router has a static route to the mapped network that points to the ASA.
4. The ASA then records that a session is established and forwards the packet from the outside interface.
5. If the destination MAC address is in its table, the ASA forwards the packet out of the outside interface. The destination MAC address is that of the upstream router, 10.1.2.1.

If the destination MAC address is not in the ASA table, the ASA attempts to discover the MAC address by sending an ARP request and a ping. The first packet is dropped.

6. The web server responds to the request; because the session is already established, the packet bypasses the many lookups associated with a new connection.
7. The ASA performs NAT by translating the mapped address to the real address, 10.1.2.27.

## An Outside User Visits a Web Server on the Inside Network

Figure 4-11 shows an outside user accessing the inside web server.

**Figure 4-11** *Outside to Inside*

The following steps describe how data moves through the ASA (see Figure 4-11):

1. A user on the outside network requests a web page from the inside web server.
2. The ASA receives the packet and adds the source MAC address to the MAC address table, if required. Because it is a new session, it verifies that the packet is allowed according to the terms of the security policy (access lists, filters, AAA).

For multiple context mode, the ASA first classifies the packet according to a unique interface.

3. The ASA records that a session is established.
4. If the destination MAC address is in its table, the ASA forwards the packet out of the inside interface. The destination MAC address is that of the downstream router, 209.165.201.1.

If the destination MAC address is not in the ASA table, the ASA attempts to discover the MAC address by sending an ARP request and a ping. The first packet is dropped.

5. The web server responds to the request; because the session is already established, the packet bypasses the many lookups associated with a new connection.
6. The ASA forwards the packet to the outside user.

## An Outside User Attempts to Access an Inside Host

Figure 4-12 shows an outside user attempting to access a host on the inside network.

**Figure 4-12**      *Outside to Inside*

The following steps describe how data moves through the ASA (see Figure 4-12):

1. A user on the outside network attempts to reach an inside host.
2. The ASA receives the packet and adds the source MAC address to the MAC address table, if required. Because it is a new session, it verifies if the packet is allowed according to the terms of the security policy (access lists, filters, AAA).  
For multiple context mode, the ASA first classifies the packet according to a unique interface.
3. The packet is denied because there is no access list permitting the outside host, and the ASA drops the packet.
4. If the outside user is attempting to attack the inside network, the ASA employs many technologies to determine if a packet is valid for an already established session.

## CHAPTER 5

# Configuring Multiple Context Mode

---

This chapter describes how to configure multiple security contexts on the ASA and includes the following sections:

- [Information About Security Contexts, page 5-1](#)
- [Licensing Requirements for Multiple Context Mode, page 5-12](#)
- [Guidelines and Limitations, page 5-13](#)
- [Default Settings, page 5-14](#)
- [Configuring Multiple Contexts, page 5-14](#)
- [Changing Between Contexts and the System Execution Space, page 5-23](#)
- [Managing Security Contexts, page 5-24](#)
- [Monitoring Security Contexts, page 5-27](#)
- [Configuration Examples for Multiple Context Mode, page 5-38](#)
- [Feature History for Multiple Context Mode, page 5-39](#)

## Information About Security Contexts

You can partition a single ASA into multiple virtual devices, known as security contexts. Each context is an independent device, with its own security policy, interfaces, and administrators. Multiple contexts are similar to having multiple standalone devices. Many features are supported in multiple context mode, including routing tables, firewall features, IPS, and management. Some features are not supported, including VPN and dynamic routing protocols.

### Note

When the ASA is configured for security contexts (for example, for Active/Active Stateful Failover), IPsec or SSL VPN cannot be enabled. Therefore, these features are unavailable.

This section provides an overview of security contexts and includes the following topics:

- [Common Uses for Security Contexts, page 5-2](#)
- [Context Configuration Files, page 5-2](#)
- [How the ASA Classifies Packets, page 5-3](#)
- [Cascading Security Contexts, page 5-6](#)
- [Management Access to Security Contexts, page 5-7](#)

- [Information About Resource Management, page 5-8](#)
- [Information About MAC Addresses, page 5-11](#)

## Common Uses for Security Contexts

You might want to use multiple security contexts in the following situations:

- You are a service provider and want to sell security services to many customers. By enabling multiple security contexts on the ASA, you can implement a cost-effective, space-saving solution that keeps all customer traffic separate and secure, and also eases configuration.
- You are a large enterprise or a college campus and want to keep departments completely separate.
- You are an enterprise that wants to provide distinct security policies to different departments.
- You have any network that requires more than one ASA.

## Context Configuration Files

This section describes how the ASA implements multiple context mode configurations and includes the following sections:

- [Context Configurations, page 5-2](#)
- [System Configuration, page 5-2](#)
- [Admin Context Configuration, page 5-2](#)

### Context Configurations

The ASA includes a configuration for each context that identifies the security policy, interfaces, and almost all the options you can configure on a standalone device. You can store context configurations on the internal flash memory or the external flash memory card, or you can download them from a TFTP, FTP, or HTTP(S) server.

### System Configuration

The system administrator adds and manages contexts by configuring each context configuration location, allocated interfaces, and other context operating parameters in the system configuration, which, like a single mode configuration, is the startup configuration. The system configuration identifies basic settings for the ASA. The system configuration does not include any network interfaces or network settings for itself; rather, when the system needs to access network resources (such as downloading the contexts from the server), it uses one of the contexts that is designated as the *admin context*. The system configuration does include a specialized failover interface for failover traffic only.

### Admin Context Configuration

The admin context is just like any other context, except that when a user logs in to the admin context, then that user has system administrator rights and can access the system and all other contexts. The admin context is not restricted in any way, and can be used as a regular context. However, because

logging into the admin context grants you administrator privileges over all contexts, you might need to restrict access to the admin context to appropriate users. The admin context must reside on flash memory, and not remotely.

If your system is already in multiple context mode, or if you convert from single mode, the admin context is created automatically as a file on the internal flash memory called `admin.cfg`. This context is named “admin.” If you do not want to use `admin.cfg` as the admin context, you can change the admin context.

## How the ASA Classifies Packets

Each packet that enters the ASA must be classified, so that the ASA can determine to which context to send a packet. This section includes the following topics:

- [Valid Classifier Criteria, page 5-3](#)
- [Classification Examples, page 5-4](#)

**Note**

If the destination MAC address is a multicast or broadcast MAC address, the packet is duplicated and delivered to each context.

### Valid Classifier Criteria

This section describes the criteria used by the classifier and includes the following topics:

- [Unique Interfaces, page 5-3](#)
- [Unique MAC Addresses, page 5-3](#)
- [NAT Configuration, page 5-4](#)

**Note**

For management traffic destined for an interface, the interface IP address is used for classification.

The routing table is not used for packet classification.

### Unique Interfaces

If only one context is associated with the ingress interface, the ASA classifies the packet into that context. In transparent firewall mode, unique interfaces for contexts are required, so this method is used to classify packets at all times.

### Unique MAC Addresses

If multiple contexts share an interface, then the classifier uses the interface MAC address. The ASA lets you assign a different MAC address in each context to the same shared interface. By default, shared interfaces do not have unique MAC addresses; the interface uses the burned-in MAC address in every context. An upstream router cannot route directly to a context without unique MAC addresses. You can set the MAC addresses manually when you configure each interface (see the [“Configuring the MAC Address and MTU” section on page 8-8](#)), or you can automatically generate MAC addresses (see the [“Automatically Assigning MAC Addresses to Context Interfaces” section on page 5-23](#)).

## NAT Configuration

If you do not use unique MAC addresses, then the mapped addresses in your NAT configuration are used to classify packets. We recommend using MAC addresses instead of NAT, so that traffic classification can occur regardless of the completeness of the NAT configuration.

## Classification Examples

Figure 5-1 shows multiple contexts sharing an outside interface. The classifier assigns the packet to Context B because Context B includes the MAC address to which the router sends the packet.

**Figure 5-1** Packet Classification with a Shared Interface using MAC Addresses

153367

Note that all new incoming traffic must be classified, even from inside networks. [Figure 5-2](#) shows a host on the Context B inside network accessing the Internet. The classifier assigns the packet to Context B because the ingress interface is Gigabit Ethernet 0/1.3, which is assigned to Context B.

**Figure 5-2** Incoming Traffic from Inside Networks

For transparent firewalls, you must use unique interfaces. [Figure 5-3](#) shows a host on the Context B inside network accessing the Internet. The classifier assigns the packet to Context B because the ingress interface is Gigabit Ethernet 1/0.3, which is assigned to Context B.

**Figure 5-3** Transparent Firewall Contexts

## Cascading Security Contexts

Placing a context directly in front of another context is called cascading contexts; the outside interface of one context is the same interface as the inside interface of another context. You might want to cascade contexts if you want to simplify the configuration of some contexts by configuring shared parameters in the top context.

### Note

Cascading contexts requires that you configure unique MAC addresses for each context interface. Because of the limitations of classifying packets on shared interfaces without MAC addresses, we do not recommend using cascading contexts without unique MAC addresses.

Figure 5-4 shows a gateway context with two contexts behind the gateway.

**Figure 5-4 Cascading Contexts**

## Management Access to Security Contexts

The ASA provides system administrator access in multiple context mode as well as access for individual context administrators. The following sections describe logging in as a system administrator or as a context administrator:

- [System Administrator Access, page 5-7](#)
- [Context Administrator Access, page 5-8](#)

### System Administrator Access

You can access the ASA as a system administrator in two ways:

- Access the ASA console.  
From the console, you access the *system execution space*, which means that any commands you enter affect only the system configuration or the running of the system (for run-time commands).
- Access the admin context using Telnet, SSH, or ASDM.

See [Chapter 37, “Configuring Management Access,”](#) to enable Telnet, SSH, and SDM access.

As the system administrator, you can access all contexts.

When you change to a context from admin or the system, your username changes to the default “enable\_15” username. If you configured command authorization in that context, you need to either configure authorization privileges for the “enable\_15” user, or you can log in as a different name for which you provide sufficient privileges in the command authorization configuration for the context. To

log in with a username, enter the **login** command. For example, you log in to the admin context with the username “admin.” The admin context does not have any command authorization configuration, but all other contexts include command authorization. For convenience, each context configuration includes a user “admin” with maximum privileges. When you change from the admin context to context A, your username is altered, so you must log in again as “admin” by entering the **login** command. When you change to context B, you must again enter the **login** command to log in as “admin.”

The system execution space does not support any AAA commands, but you can configure its own enable password, as well as usernames in the local database to provide individual logins.

## Context Administrator Access

You can access a context using Telnet, SSH, or ASDM. If you log in to a non-admin context, you can only access the configuration for that context. You can provide individual logins to the context. See [Chapter 37, “Configuring Management Access,”](#) to enable Telnet, SSH, and SDM access and to configure management authentication.

## Information About Resource Management

By default, all security contexts have unlimited access to the resources of the ASA, except where maximum limits per context are enforced. However, if you find that one or more contexts use too many resources, and they cause other contexts to be denied connections, for example, then you can configure resource management to limit the use of resources per context.

The ASA manages resources by assigning contexts to resource classes. Each context uses the resource limits set by the class.

This section includes the following topics:

- [Resource Limits, page 5-8](#)
- [Default Class, page 5-9](#)
- [Class Members, page 5-10](#)

## Resource Limits

When you create a class, the ASA does not set aside a portion of the resources for each context assigned to the class; rather, the ASA sets the maximum limit for a context. If you oversubscribe resources, or allow some resources to be unlimited, a few contexts can “use up” those resources, potentially affecting service to other contexts.

You can set the limit for individual resources, as a percentage (if there is a hard system limit) or as an absolute value.

You can oversubscribe the ASA by assigning more than 100 percent of a resource across all contexts. For example, you can set the Bronze class to limit connections to 20 percent per context, and then assign 10 contexts to the class for a total of 200 percent. If contexts concurrently use more than the system limit, then each context gets less than the 20 percent you intended. (See [Figure 5-5.](#))

**Figure 5-5 Resource Oversubscription**

If you assign an absolute value to a resource across all contexts that exceeds the practical limit of the ASA, then the performance of the ASA might be impaired.

The ASA lets you assign unlimited access to one or more resources in a class, instead of a percentage or absolute number. When a resource is unlimited, contexts can use as much of the resource as the system has available or that is practically available. For example, Context A, B, and C are in the Silver Class, which limits each class member to 1 percent of the connections, for a total of 3 percent; but the three contexts are currently only using 2 percent combined. Gold Class has unlimited access to connections. The contexts in the Gold Class can use more than the 97 percent of “unassigned” connections; they can also use the 1 percent of connections not currently in use by Context A, B, and C, even if that means that Context A, B, and C are unable to reach their 3 percent combined limit. (See [Figure 5-6](#).) Setting unlimited access is similar to oversubscribing the ASA, except that you have less control over how much you oversubscribe the system.

**Figure 5-6 Unlimited Resources**

## Default Class

All contexts belong to the default class if they are not assigned to another class; you do not have to actively assign a context to the default class.

If a context belongs to a class other than the default class, those class settings always override the default class settings. However, if the other class has any settings that are not defined, then the member context uses the default class for those limits. For example, if you create a class with a 2 percent limit for all concurrent connections, but no other limits, then all other limits are inherited from the default class. Conversely, if you create a class with a limit for all resources, the class uses no settings from the default class.

By default, the default class provides unlimited access to resources for all contexts, except for the following limits, which are by default set to the maximum allowed per context:

- Telnet sessions—5 sessions.
- SSH sessions—5 sessions.
- IPsec sessions—5 sessions.
- MAC addresses—65,535 entries.

Figure 5-7 shows the relationship between the default class and other classes. Contexts A and C belong to classes with some limits set; other limits are inherited from the default class. Context B inherits no limits from default because all limits are set in its class, the Gold class. Context D was not assigned to a class, and is by default a member of the default class.

**Figure 5-7 Resource Classes**

104689

## Class Members

To use the settings of a class, assign the context to the class when you define the context. All contexts belong to the default class if they are not assigned to another class; you do not have to actively assign a context to default. You can only assign a context to one resource class. The exception to this rule is that limits that are undefined in the member class are inherited from the default class; so in effect, a context could be a member of default plus another class.

## Information About MAC Addresses

To allow contexts to share interfaces, we suggest that you assign unique MAC addresses to each shared context interface (see the [“Automatically Assigning MAC Addresses to Context Interfaces”](#) section on page 5-23).

The MAC address is used to classify packets within a context. If you share an interface, but do not have unique MAC addresses for the interface in each context, then the destination IP address is used to classify packets. The destination address is matched with the context NAT configuration, and this method has some limitations compared to the MAC address method. See the [“How the ASA Classifies Packets”](#) section on page 5-3 for information about classifying packets.

In the rare circumstance that the generated MAC address conflicts with another private MAC address in your network, you can manually set the MAC address for the interface within the context. See the [“Configuring the MAC Address and MTU”](#) section on page 8-8 to manually set the MAC address.

This section includes the following topics:

- [Default MAC Address, page 5-11](#)
- [Interaction with Manual MAC Addresses, page 5-11](#)
- [Failover MAC Addresses, page 5-11](#)
- [MAC Address Format, page 5-12](#)

### Default MAC Address

For the ASA 5500 series appliances—By default, the physical interface uses the burned-in MAC address, and all subinterfaces of a physical interface use the same burned-in MAC address.

When specifying a prefix for the MAC address, all auto-generated MAC addresses start with A2. The auto-generated MAC addresses are persistent across reloads.

Without a prefix, the MAC address is generated using the following format:

- Active unit MAC address: *12\_slot.port\_subid.contextid*.
- Standby unit MAC address: *02\_slot.port\_subid.contextid*.

### Interaction with Manual MAC Addresses

If you manually assign a MAC address and also enable auto-generation, then the manually assigned MAC address is used. If you later remove the manual MAC address, the auto-generated address is used.

Because auto-generated addresses (when using a prefix) start with A2, you cannot start manual MAC addresses with A2 if you also want to use auto-generation.

### Failover MAC Addresses

For use with failover, the ASA generates both an active and standby MAC address for each interface. If the active unit fails over and the standby unit becomes active, the new active unit starts using the active MAC addresses to minimize network disruption. See the [“MAC Address Format”](#) section for more information.

## MAC Address Format

The format depends on whether you configure a prefix or not.

### MAC Address Format Using a Prefix

The ASA generates the MAC address using the following format:

`A2xx.yyzz.zzzz`

Where `xx.yy` is a user-defined prefix, and `zz.zzzz` is an internal counter generated by the ASA. For the standby MAC address, the address is identical except that the internal counter is increased by 1.

For an example of how the prefix is used, if you set a prefix of 77, then the ASA converts 77 into the hexadecimal value 004D (`yyxx`). When used in the MAC address, the prefix is reversed (`xxyy`) to match the ASA native form:

`A24D.00zz.zzzz`

For a prefix of 1009 (03F1), the MAC address is:

`A2F1.03zz.zzzz`

### MAC Address Format Without a Prefix

Without a prefix, the MAC address is generated using the following format:

- Active unit MAC address: `12_slot.port_subid.contextid`.
- Standby unit MAC address: `02_slot.port_subid.contextid`.

For platforms with no interface slots, the slot is always 0. The *port* is the interface port. The *subid* is an internal ID for the subinterface, which is not viewable. The *contextid* is an internal ID for the context, viewable with the **show context detail** command.

For example, the interface GigabitEthernet 0/1.200 in the context with the ID 1 has the following generated MAC addresses, where the internal ID for subinterface 200 is 31:

- Active: 1200.0131.0001
- Standby: 0200.0131.0001

#### Note

This MAC address generation method does not allow for:

- Persistent MAC addresses across reloads
- Multiple ASAs on the same network segment (because unique MAC addresses are not guaranteed)
- Prevention of overlapping MAC addresses with manually assigned MAC addresses.

We recommend using a prefix with the MAC address generation to avoid these issues.

## Licensing Requirements for Multiple Context Mode

| Model                                | License Requirement                                                                         |
|--------------------------------------|---------------------------------------------------------------------------------------------|
| ASA 5505                             | No support.                                                                                 |
| ASA 5510                             | Security Plus License: 2 contexts.<br><i>Optional license: 5 contexts.</i>                  |
| ASA 5520                             | Base License: 2 contexts.<br><i>Optional licenses: 5, 10, or 20 contexts.</i>               |
| ASA 5540                             | Base License: 2 contexts.<br><i>Optional licenses: 5, 10, 20, or 50 contexts.</i>           |
| ASA 5550                             | Base License: 2 contexts.<br><i>Optional licenses: 5, 10, 20, 50, or 100 contexts.</i>      |
| ASA 5580                             | Base License: 2 contexts.<br><i>Optional licenses: 5, 10, 20, 50, 100, or 250 contexts.</i> |
| ASA 5585-X with SSP-10               | Base License: 2 contexts.<br><i>Optional licenses: 5, 10, 20, 50, or 100 contexts.</i>      |
| ASA 5585-X with SSP-20, -40, and -60 | Base License: 2 contexts.<br><i>Optional licenses: 5, 10, 20, 50, 100, or 250 contexts.</i> |

## Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

### Firewall Mode Guidelines

Supported in routed and transparent firewall mode.

### Failover Guidelines

Active/Active mode failover is only supported in multiple context mode.

### IPv6 Guidelines

Supports IPv6.

### Model Guidelines

Does not support the ASA 5505.

### Unsupported Features

Multiple context mode does not support the following features:

- Dynamic routing protocols  
Security contexts support only static routes. You cannot enable OSPF, RIP, or EIGRP in multiple context mode.
- VPN

- Multicast routing. Multicast bridging is supported.
- Threat Detection
- Phone Proxy
- QoS

**Additional Guidelines**

The context mode (single or multiple) is not stored in the configuration file, even though it does endure reboots. If you need to copy your configuration to another device, set the mode on the new device to match.

## Default Settings

By default, the ASA is in single context mode.

## Configuring Multiple Contexts

This section describes how to configure multiple context mode, and includes the following topics:

- [Task Flow for Configuring Multiple Context Mode, page 5-14](#)
- [Enabling or Disabling Multiple Context Mode, page 5-15](#)
- [Configuring a Class for Resource Management, page 5-16](#)
- [Configuring a Security Context, page 5-18](#)
- [Automatically Assigning MAC Addresses to Context Interfaces, page 5-23](#)

## Task Flow for Configuring Multiple Context Mode

To configure multiple context mode, perform the following steps:

- 
- |               |                                                                                                                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | Enable multiple context mode. See the <a href="#">“Enabling or Disabling Multiple Context Mode”</a> section on <a href="#">page 5-15</a> .                                                                                 |
| <b>Step 2</b> | (Optional) Configure classes for resource management. See the <a href="#">“Configuring a Class for Resource Management”</a> section on <a href="#">page 5-16</a> .                                                         |
| <b>Step 3</b> | Configure interfaces in the system execution space. See <a href="#">Chapter 6, “Starting Interface Configuration (ASA 5510 and Higher).”</a>                                                                               |
| <b>Step 4</b> | Configure security contexts. See the <a href="#">“Configuring a Security Context”</a> section on <a href="#">page 5-18</a> .                                                                                               |
| <b>Step 5</b> | (Optional) Automatically assign MAC addresses to context interfaces. See the <a href="#">“Automatically Assigning MAC Addresses to Context Interfaces”</a> section on <a href="#">page 5-23</a> .                          |
| <b>Step 6</b> | Complete interface configuration in the context. See <a href="#">Chapter 8, “Completing Interface Configuration (Routed Mode),”</a> or <a href="#">Chapter 9, “Completing Interface Configuration (Transparent Mode).”</a> |
-

## Enabling or Disabling Multiple Context Mode

Your ASA might already be configured for multiple security contexts depending on how you ordered it from Cisco. If you are upgrading, however, you might need to convert from single mode to multiple mode by following the procedures in this section.

This section includes the following topics:

- [Enabling Multiple Context Mode, page 5-15](#)
- [Restoring Single Context Mode, page 5-15](#)

### Enabling Multiple Context Mode

When you convert from single mode to multiple mode, the ASA converts the running configuration into two files: a new startup configuration that comprises the system configuration, and admin.cfg that comprises the admin context (in the root directory of the internal flash memory). The original running configuration is saved as old\_running.cfg (in the root directory of the internal flash memory). The original startup configuration is not saved. The ASA automatically adds an entry for the admin context to the system configuration with the name “admin.”

#### Prerequisites

- When you convert from single mode to multiple mode, the ASA converts the running configuration into two files. The original startup configuration is not saved, so if it differs from the running configuration, you should back it up before proceeding.
- The context mode (single or multiple) is not stored in the configuration file, even though it does endure reboots. If you need to copy your configuration to another device, set the mode on the new device to match.

#### Detailed Steps

| Command                                                         | Purpose                                                               |
|-----------------------------------------------------------------|-----------------------------------------------------------------------|
| <code>mode multiple</code>                                      | Changes to multiple context mode. You are prompted to reboot the ASA. |
| <b>Example:</b><br><code>hostname(config)# mode multiple</code> |                                                                       |

### Restoring Single Context Mode

To copy the old running configuration to the startup configuration and to change the mode to single mode, perform the following steps.

#### Prerequisites

Perform this procedure in the system execution space.

## Detailed Steps

|        | Command                                                                                                                                           | Purpose                                                                                                |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| Step 1 | <b>copy flash:old_running.cfg startup-config</b><br><br><b>Example:</b><br><pre>hostname(config)# copy flash:old_running.cfg startup-config</pre> | Copies the backup version of your original running configuration to the current startup configuration. |
| Step 2 | <b>mode single</b><br><br><b>Example:</b><br><pre>hostname(config)# mode single</pre>                                                             | Sets the mode to single mode. You are prompted to reboot the ASA.                                      |

## Configuring a Class for Resource Management

To configure a class in the system configuration, perform the following steps. You can change the value of a particular resource limit by reentering the command with a new value.

### Prerequisites

Perform this procedure in the system execution space.

### Guidelines

[Table 5-1](#) lists the resource types and the limits. See also the **show resource types** command.

**Table 5-1 Resource Names and Limits**

| Resource Name | Rate or Concurrent | Minimum and Maximum Number per Context | System Limit <sup>1</sup>                                                                                                                                                           | Description                                                                                                    |
|---------------|--------------------|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| mac-addresses | Concurrent         | N/A                                    | 65,535                                                                                                                                                                              | For transparent firewall mode, the number of MAC addresses allowed in the MAC address table.                   |
| conns         | Concurrent or Rate | N/A                                    | Concurrent connections: See the <a href="#">“Supported Feature Licenses Per Model”</a> section on <a href="#">page 3-1</a> for the connection limit for your platform.<br>Rate: N/A | TCP or UDP connections between any two hosts, including connections between one host and multiple other hosts. |
| inspects      | Rate               | N/A                                    | N/A                                                                                                                                                                                 | Application inspections.                                                                                       |
| hosts         | Concurrent         | N/A                                    | N/A                                                                                                                                                                                 | Hosts that can connect through the ASA.                                                                        |

Table 5-1 Resource Names and Limits (continued)

| Resource Name | Rate or Concurrent | Minimum and Maximum Number per Context | System Limit <sup>1</sup> | Description                                                                                                                                                                                                                                                                                                      |
|---------------|--------------------|----------------------------------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| asdm          | Concurrent         | 1 minimum<br>5 maximum                 | 32                        | ASDM management sessions.<br><br><b>Note</b> ASDM sessions use two HTTPS connections: one for monitoring that is always present, and one for making configuration changes that is present only when you make changes. For example, the system limit of 32 ASDM sessions represents a limit of 64 HTTPS sessions. |
| ssh           | Concurrent         | 1 minimum<br>5 maximum                 | 100                       | SSH sessions.                                                                                                                                                                                                                                                                                                    |
| syslogs       | Rate               | N/A                                    | N/A                       | System log messages.                                                                                                                                                                                                                                                                                             |

1. If this column value is N/A, then you cannot set a percentage of the resource because there is no hard system limit for the resource.

## Detailed Steps

|               | Command                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>class</b> <i>name</i><br><br><b>Example:</b><br><pre>hostname(config)# threat-detection scanning-threat shun except ip-address 10.1.1.0 255.255.255.0</pre> | Specifies the class name and enters the class configuration mode. The <i>name</i> is a string up to 20 characters long. To set the limits for the default class, enter <b>default</b> for the name.                                                                                                                                                                                                                                                                     |
| <b>Step 2</b> | Do one or more of the following:                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|               | <b>limit-resource all 0</b><br><br><b>Example:</b><br><pre>hostname(config)# limit-resource all 0</pre>                                                        | Sets all resource limits (shown in <a href="#">Table 5-1</a> ) to be unlimited. For example, you might want to create a class that includes the admin context that has no limitations. The default class has all resources set to unlimited by default.                                                                                                                                                                                                                 |
|               | <b>limit-resource [rate] resource_name number[%]</b><br><br><b>Example:</b><br><pre>hostname(config)# limit-resource rate inspects 10</pre>                    | Sets a particular resource limit. For this particular resource, the limit overrides the limit set for <b>all</b> . Enter the <b>rate</b> argument to set the rate per second for certain resources. For resources that do not have a system limit, you cannot set the percentage (%) between 1 and 100; you can only set an absolute value. See <a href="#">Table 5-1</a> for resources for which you can set the rate per second and which do not have a system limit. |

## Examples

For example, to set the default class limit for conns to 10 percent instead of unlimited, enter the following commands:

```
hostname(config)# class default
hostname(config-class)# limit-resource conns 10%
```

All other resources remain at unlimited.

To add a class called gold, enter the following commands:

```
hostname(config)# class gold
hostname(config-class)# limit-resource mac-addresses 10000
hostname(config-class)# limit-resource conns 15%
hostname(config-class)# limit-resource rate conns 1000
hostname(config-class)# limit-resource rate inspects 500
hostname(config-class)# limit-resource hosts 9000
hostname(config-class)# limit-resource asdm 5
hostname(config-class)# limit-resource ssh 5
hostname(config-class)# limit-resource rate syslogs 5000
hostname(config-class)# limit-resource telnet 5
hostname(config-class)# limit-resource xlates 36000
```

## Configuring a Security Context

The security context definition in the system configuration identifies the context name, configuration file URL, and interfaces that a context can use.

### Prerequisites

- Perform this procedure in the system execution space.
- For ASA 5500 series appliances, configure physical interface parameters, VLAN subinterfaces, and redundant interfaces according to the [Chapter 6, “Starting Interface Configuration \(ASA 5510 and Higher\).”](#)
- If you do not have an admin context (for example, if you clear the configuration) then you must first specify the admin context name by entering the following command:

```
hostname(config)# admin-context name
```

Although this context name does not exist yet in your configuration, you can subsequently enter the **context name** command to match the specified name to continue the admin context configuration.

## Detailed Steps

|        | Command                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|-----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>context</b> <i>name</i><br><br><b>Example:</b><br>hostname(config)# context administrator                                      | Adds or modifies a context. The <i>name</i> is a string up to 32 characters long. This name is case sensitive, so you can have two contexts named “customerA” and “CustomerA,” for example. You can use letters, digits, or hyphens, but you cannot start or end the name with a hyphen.<br><br>“System” or “Null” (in upper or lower case letters) are reserved names, and cannot be used. |
| Step 2 | (Optional)<br><br><b>description</b> <i>text</i><br><br><b>Example:</b><br>hostname(config)# description<br>Administrator Context | Adds a description for this context.                                                                                                                                                                                                                                                                                                                                                        |

| Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Step 3</b></p> <p>To allocate a physical interface:</p> <pre>allocate-interface physical_interface [mapped_name] [visible   invisible] [service-shared]</pre> <p>To allocate one or more subinterfaces:</p> <pre>allocate-interface physical_interface.subinterface[-physical_ interface.subinterface] [mapped_name[-mapped_name]] [visible   invisible] [service-shared]</pre> <p><b>Example:</b></p> <pre>hostname(config-ctx)# allocate-interface gigabitethernet0/1.100 int1 hostname(config-ctx)# allocate-interface gigabitethernet0/1.200 int2 hostname(config-ctx)# allocate-interface gigabitethernet0/2.300-gigabitethernet0/2. 305 int3-int8</pre> | <p>Specifies the interfaces you can use in the context. Do not include a space between the interface type and the port number.</p> <p>Enter these commands multiple times to specify different ranges. If you remove an allocation with the <b>no</b> form of this command, then any context commands that include this interface are removed from the running configuration.</p> <p>Transparent firewall mode allows a limited number of interfaces to pass through traffic; however, you can use a dedicated management interface, Management <i>slot/port</i>, (either the physical interface or a subinterface) as an additional interface for management traffic. The management interface for transparent mode does not flood a packet out the interface when that packet is not in the MAC address table.</p> <p>You can assign the same interfaces to multiple contexts in routed mode, if desired. Transparent mode does not allow shared interfaces unless you want to share the Service Insertion Architecture (SIA) data-plane or control-plane interface. To share these interfaces, specify the <b>service-shared</b> keyword.</p> <p>The <i>mapped_name</i> is an alphanumeric alias for the interface that can be used within the context instead of the interface ID. If you do not specify a mapped name, the interface ID is used within the context. For security purposes, you might not want the context administrator to know which interfaces are being used by the context.</p> <p>A mapped name must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, or an underscore. For example, you can use the following names:</p> <pre>int0, inta, int_0</pre> <p>If you specify a range of subinterfaces, you can specify a matching range of mapped names. Follow these guidelines for ranges:</p> <ul style="list-style-type: none"> <li>The mapped name must consist of an alphabetic portion followed by a numeric portion. The alphabetic portion of the mapped name must match for both ends of the range. For example, enter the following range: <pre>int0-int10</pre> <p>If you enter <code>gig0/1.1-gig0/1.5 happy1-sad5</code>, for example, the command fails.</p> </li> <li>The numeric portion of the mapped name must include the same quantity of numbers as the subinterface range. For example, both ranges include 100 interfaces: <pre>gigabitethernet0/0.100-gigabitethernet0/0.199 int1-int100</pre> <p>If you enter <code>gig0/0.100-gig0/0.199 int1-int15</code>, for example, the command fails.</p> </li> </ul> <p>Specify <b>visible</b> to see the real interface ID in the <b>show interface</b> command if you set a mapped name. The default <b>invisible</b> keyword shows only the mapped name.</p> |

|        | Command                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <p><b>config-url</b> <i>url</i></p> <p><b>Example:</b></p> <pre>hostname(config-ctx)# config-url ftp://user1:passw0rd@10.1.1.1/configlets/t est.cfg</pre> | <p>Identifies the URL from which the system downloads the context configuration. When you add a context URL, the system immediately loads the context so that it is running, if the configuration is available.</p> <p><b>Note</b> Enter the <b>allocate-interface</b> command(s) before you enter the <b>config-url</b> command. If you enter the <b>config-url</b> command first, the ASA loads the context configuration immediately. If the context contains any commands that refer to (not yet configured) interfaces, those commands fail.</p> <p>The filename does not require a file extension, although we recommend using “.cfg”. The server must be accessible from the admin context. If the configuration file is not available, you see the following message:</p> <pre>WARNING: Could not fetch the URL disk:/url INFO: Creating context with default config</pre> <p>For non-HTTP(S) URL locations, after you specify the URL, you can then change to the context, configure it at the CLI, and enter the <b>write memory</b> command to write the file to the URL location. (HTTP(S) is read only).</p> <p><b>Note</b> The admin context file must be stored on the internal flash memory.</p> <p>See the following URL syntax:</p> <ul style="list-style-type: none"> <li>• <b>disk:</b><i>/[path]/filename</i><br/>This URL indicates the internal flash memory.</li> <li>• <b>ftp:</b><i>//[user[:password]]@[server[:port]]/[path]/filename[:type=xx]</i><br/>The <b>type</b> can be one of the following keywords: <ul style="list-style-type: none"> <li>– <b>ap</b>—ASCII passive mode</li> <li>– <b>an</b>—ASCII normal mode</li> <li>– <b>ip</b>—(Default) Binary passive mode</li> <li>– <b>in</b>—Binary normal mode</li> </ul> </li> <li>• <b>http[s]:</b><i>//[user[:password]]@[server[:port]]/[path]/filename</i><br/>If you change to the context and configure the context at the CLI, you cannot save changes back to HTTP or HTTPS servers using the <b>write memory</b> command. You can, however, use the <b>copy tftp</b> command to copy the running configuration to a TFTP server.</li> <li>• <b>tftp:</b><i>//[user[:password]]@[server[:port]]/[path]/filename[:int=interface_name]</i></li> </ul> <p>To change the URL, reenter the <b>config-url</b> command with a new URL. See the <a href="#">“Changing the Security Context URL” section on page 5-25</a> for more information about changing the URL.</p> |

|        | Command                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                       |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | (Optional)<br><b>member</b> <i>class_name</i><br><br><b>Example:</b><br>hostname(config-ctx)# member gold                                                             | Assigns the context to a resource class. If you do not specify a class, the context belongs to the default class. You can only assign a context to one resource class.                                                                                        |
| Step 6 | (Optional)<br><b>allocate-ips</b> <i>sensor_name</i> [ <i>mapped_name</i> ]<br>[default]<br><br><b>Example:</b><br>hostname(config-ctx)# allocate-ips sensor1 highsec | Assigns an IPS virtual sensor to this context if you have the AIP SSM installed.<br><br>See the <a href="#">“Assigning Virtual Sensors to a Security Context (ASA 5510 and Higher)”</a> section on page 58-12 for detailed information about virtual sensors. |

## Examples

The following example sets the admin context to be “administrator,” creates a context called “administrator” on the internal flash memory, and then adds two contexts from an FTP server:

```
hostname(config)# admin-context administrator
hostname(config)# context administrator
hostname(config-ctx)# allocate-interface gigabitethernet0/0.1
hostname(config-ctx)# allocate-interface gigabitethernet0/1.1
hostname(config-ctx)# config-url flash:/admin.cfg

hostname(config-ctx)# context test
hostname(config-ctx)# allocate-interface gigabitethernet0/0.100 int1
hostname(config-ctx)# allocate-interface gigabitethernet0/0.102 int2
hostname(config-ctx)# allocate-interface gigabitethernet0/0.110-gigabitethernet0/0.115
int3-int8
hostname(config-ctx)# config-url ftp://user1:passw0rd@10.1.1.1/configlets/test.cfg
hostname(config-ctx)# member gold

hostname(config-ctx)# context sample
hostname(config-ctx)# allocate-interface gigabitethernet0/1.200 int1
hostname(config-ctx)# allocate-interface gigabitethernet0/1.212 int2
hostname(config-ctx)# allocate-interface gigabitethernet0/1.230-gigabitethernet0/1.235
int3-int8
hostname(config-ctx)# config-url ftp://user1:passw0rd@10.1.1.1/configlets/sample.cfg
hostname(config-ctx)# member silver
```

## Automatically Assigning MAC Addresses to Context Interfaces

This section describes how to configure auto-generation of MAC addresses.

The MAC address is used to classify packets within a context. See the [“Information About MAC Addresses” section on page 5-11](#) for more information. See also the [“Viewing Assigned MAC Addresses” section on page 5-35](#).

### Guidelines

- When you configure a **nameif** command for the interface in a context, the new MAC address is generated immediately. If you enable this feature after you configure context interfaces, then MAC addresses are generated for all interfaces immediately after you enable it. If you disable this feature, the MAC address for each interface reverts to the default MAC address. For example, subinterfaces of GigabitEthernet 0/1 revert to using the MAC address of GigabitEthernet 0/1.
- In the rare circumstance that the generated MAC address conflicts with another private MAC address in your network, you can manually set the MAC address for the interface within the context. See the [“Configuring the MAC Address and MTU” section on page 8-8](#) to manually set the MAC address.

### Detailed Steps

| Command                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mac-address auto</b> [ <b>prefix</b> <i>prefix</i> ]         | Automatically assign private MAC addresses to each context interface.                                                                                                                                                                                                                                                                                                                         |
| <b>Example:</b><br>hostname(config)# mac-address auto prefix 19 | The <i>prefix</i> is a decimal value between 0 and 65535. This prefix is converted to a 4-digit hexadecimal number, and used as part of the MAC address. The prefix ensures that each ASA uses unique MAC addresses, so you can have multiple ASAs on a network segment, for example. See the <a href="#">“MAC Address Format”</a> section for more information about how the prefix is used. |

## Changing Between Contexts and the System Execution Space

If you log in to the system execution space (or the admin context using Telnet or SSH), you can change between contexts and perform configuration and monitoring tasks within each context. The running configuration that you edit in a configuration mode, or that is used in the **copy** or **write** commands, depends on your location. When you are in the system execution space, the running configuration consists only of the system configuration; when you are in a context, the running configuration consists only of that context. For example, you cannot view all running configurations (system plus all contexts) by entering the **show running-config** command. Only the current configuration displays.

To change between the system execution space and a context, or between contexts, see the following commands:

| Command                            | Purpose                                                                                  |
|------------------------------------|------------------------------------------------------------------------------------------|
| <code>changeto context name</code> | Changes to a context. The prompt changes to the following:<br>hostname/name#             |
| <code>changeto system</code>       | Changes to the system execution space. The prompt changes to the following:<br>hostname# |

# Managing Security Contexts

This section describes how to manage security contexts and includes the following topics:

- [Removing a Security Context, page 5-24](#)
- [Changing the Admin Context, page 5-25](#)
- [Changing the Security Context URL, page 5-25](#)
- [Reloading a Security Context, page 5-26](#)

## Removing a Security Context

You can only remove a context by editing the system configuration. You cannot remove the current admin context, unless you remove all contexts using the **clear context** command.

**Note**

If you use failover, there is a delay between when you remove the context on the active unit and when the context is removed on the standby unit. You might see an error message indicating that the number of interfaces on the active and standby units are not consistent; this error is temporary and can be ignored.

### Prerequisites

Perform this procedure in the system execution space.

### Detailed Steps

| Command                      | Purpose                                                          |
|------------------------------|------------------------------------------------------------------|
| <code>no context name</code> | Removes a single context. All context commands are also removed. |
| <code>clear context</code>   | Removes all contexts (including the admin context).              |

## Changing the Admin Context

The system configuration does not include any network interfaces or network settings for itself; rather, when the system needs to access network resources (such as downloading the contexts from the server), it uses one of the contexts that is designated as the admin context.

The admin context is just like any other context, except that when a user logs in to the admin context, then that user has system administrator rights and can access the system and all other contexts. The admin context is not restricted in any way, and can be used as a regular context. However, because logging into the admin context grants you administrator privileges over all contexts, you might need to restrict access to the admin context to appropriate users.

### Guidelines

You can set any context to be the admin context, as long as the configuration file is stored in the internal flash memory.

### Prerequisites

Perform this procedure in the system execution space.

### Detailed Steps

| Command                                                                       | Purpose                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>admin-context context_name</code>                                       | Sets the admin context. Any remote management sessions, such as Telnet, SSH, or HTTPS, that are connected to the admin context are terminated. You must reconnect to the new admin context.                                                                                                         |
| <b>Example:</b><br><code>hostname(config)# admin-context administrator</code> | <b>Note</b> A few system commands, including <b>ntp server</b> , identify an interface name that belongs to the admin context. If you change the admin context, and that interface name does not exist in the new admin context, be sure to update any system commands that refer to the interface. |

## Changing the Security Context URL

This section describes how to change the context URL.

### Guidelines

- You cannot change the security context URL without reloading the configuration from the new URL. The ASA merges the new configuration with the current running configuration.
- Reentering the same URL also merges the saved configuration with the running configuration.

A merge adds any new commands from the new configuration to the running configuration.

- If the configurations are the same, no changes occur.

- If commands conflict or if commands affect the running of the context, then the effect of the merge depends on the command. You might get errors, or you might have unexpected results. If the running configuration is blank (for example, if the server was unavailable and the configuration was never downloaded), then the new configuration is used.

If you do not want to merge the configurations, you can clear the running configuration, which disrupts any communications through the context, and then reload the configuration from the new URL.

## Prerequisites

Perform this procedure in the system execution space.

## Detailed Steps

|               | Command                                                                                                                                                                                                                                                  | Purpose                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | (Optional, if you do not want to perform a merge)<br><br><b>changeto context</b> <i>name</i><br><b>clear configure all</b><br><br><b>Example:</b><br>hostname(config)# <b>changeto context</b> ctx1<br>hostname/ctx1(config)# <b>clear configure all</b> | Changes to the context and clears its configuration. If you want to perform a merge, skip to Step 2. |
| <b>Step 2</b> | <b>changeto system</b><br><br><b>Example:</b><br>hostname/ctx1(config)# <b>changeto system</b><br>hostname(config)#                                                                                                                                      | Changes to the system execution space.                                                               |
| <b>Step 3</b> | <b>context</b> <i>name</i><br><br><b>Example:</b><br>hostname(config)# context ctx1                                                                                                                                                                      | Enters the context configuration mode for the context you want to change.                            |
| <b>Step 4</b> | <b>config-url</b> <i>new_url</i><br><br><b>Example:</b><br>hostname(config)# config-url<br>ftp://user1:passw0rd@10.1.1.1/configlets/c<br>tx1.cfg                                                                                                         | Enters the new URL. The system immediately loads the context so that it is running.                  |

## Reloading a Security Context

You can reload the context in two ways:

- Clear the running configuration and then import the startup configuration.  
This action clears most attributes associated with the context, such as connections and NAT tables.
- Remove the context from the system configuration.

This action clears additional attributes, such as memory allocation, which might be useful for troubleshooting. However, to add the context back to the system requires you to respecify the URL and interfaces.

This section includes the following topics:

- [Reloading by Clearing the Configuration, page 5-27](#)
- [Reloading by Removing and Re-adding the Context, page 5-27](#)

## Reloading by Clearing the Configuration

To reload the context by clearing the context configuration, and reloading the configuration from the URL, perform the following steps.

### Detailed Steps

|        | Command                                                                                                                         | Purpose                                                                                                                                                          |
|--------|---------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>changeto context</b> <i>name</i><br><br><b>Example:</b><br>hostname(comfig)# changeto context ctx1<br>hostname/ctx1(comfig)# | Changes to the context that you want to reload.                                                                                                                  |
| Step 2 | <b>clear configure all</b><br><br><b>Example:</b><br>hostname/ctx1(config)# clear configure all                                 | Clears the running configuration. This command clears all connections.                                                                                           |
| Step 3 | <b>copy startup-config running-config</b><br><br><b>Example:</b><br>hostname/ctx1(config)# copy startup-config running-config   | Reloads the configuration. The ASA copies the configuration from the URL specified in the system configuration. You cannot change the URL from within a context. |

## Reloading by Removing and Re-adding the Context

To reload the context by removing the context and then re-adding it, perform the steps in the following sections:

1. [“Removing a Security Context” section on page 5-24](#)
2. [“Configuring a Security Context” section on page 5-18](#)

## Monitoring Security Contexts

This section describes how to view and monitor context information and includes the following topics:

- [Viewing Context Information, page 5-28](#)
- [Viewing Context Information, page 5-28](#)

- [Viewing Resource Allocation, page 5-29](#)
- [Viewing Resource Usage, page 5-32](#)
- [Monitoring SYN Attacks in Contexts, page 5-33](#)
- [Viewing Assigned MAC Addresses, page 5-35](#)

## Viewing Context Information

From the system execution space, you can view a list of contexts including the name, allocated interfaces, and configuration file URL.

From the system execution space, view all contexts by entering the following command:

| Command                                                                  | Purpose                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>show context</code> [ <i>name</i>   <b>detail</b>   <b>count</b> ] | Shows all contexts.<br><br>The <b>detail</b> option shows additional information. See the following sample outputs below for more information.<br><br>If you want to show information for a particular context, specify the <i>name</i> .<br><br>The <b>count</b> option shows the total number of contexts. |

The following is sample output from the **show context** command. The following sample output shows three contexts:

```
hostname# show context

Context Name Interfaces URL
*admin GigabitEthernet0/1.100 disk0:/admin.cfg
 GigabitEthernet0/1.101
contexta GigabitEthernet0/1.200 disk0:/contexta.cfg
 GigabitEthernet0/1.201
contextb GigabitEthernet0/1.300 disk0:/contextb.cfg
 GigabitEthernet0/1.301
Total active Security Contexts: 3
```

[Table 5-2](#) shows each field description.

**Table 5-2** *show context Fields*

| Field        | Description                                                                           |
|--------------|---------------------------------------------------------------------------------------|
| Context Name | Lists all context names. The context name with the asterisk (*) is the admin context. |
| Interfaces   | The interfaces assigned to the context.                                               |
| URL          | The URL from which the ASA loads the context configuration.                           |

The following is sample output from the **show context detail** command:

```
hostname# show context detail

Context "admin", has been created, but initial ACL rules not complete
Config URL: disk0:/admin.cfg
Real Interfaces: Management0/0
Mapped Interfaces: Management0/0
```

```

Flags: 0x00000013, ID: 1

Context "ctx", has been created, but initial ACL rules not complete
Config URL: ctx.cfg
Real Interfaces: GigabitEthernet0/0.10, GigabitEthernet0/1.20,
 GigabitEthernet0/2.30
Mapped Interfaces: int1, int2, int3
Flags: 0x00000011, ID: 2

Context "system", is a system resource
Config URL: startup-config
Real Interfaces:
Mapped Interfaces: Control0/0, GigabitEthernet0/0,
 GigabitEthernet0/0.10, GigabitEthernet0/1, GigabitEthernet0/1.10,
 GigabitEthernet0/1.20, GigabitEthernet0/2, GigabitEthernet0/2.30,
 GigabitEthernet0/3, Management0/0, Management0/0.1
Flags: 0x00000019, ID: 257

Context "null", is a system resource
Config URL: ... null ...
Real Interfaces:
Mapped Interfaces:
Flags: 0x00000009, ID: 258

```

See the *Cisco ASA 5500 Series Command Reference* for more information about the **detail** output.

The following is sample output from the **show context count** command:

```

hostname# show context count
Total active contexts: 2

```

## Viewing Resource Allocation

From the system execution space, you can view the allocation for each resource across all classes and class members.

To view the resource allocation, enter the following command:

| Command                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show resource allocation [detail]</b> | Shows the resource allocation. This command shows the resource allocation, but does not show the actual resources being used. See the <a href="#">“Viewing Resource Usage” section on page 5-32</a> for more information about actual resource usage.<br><br>The <b>detail</b> argument shows additional information. See the following sample outputs for more information. |

The following sample output shows the total allocation of each resource as an absolute value and as a percentage of the available system resources:

```

hostname# show resource allocation
Resource Total % of Avail
Conns [rate] 35000 N/A
Inspects [rate] 35000 N/A
Syslogs [rate] 10500 N/A
Conns 305000 30.50%
Hosts 78842 N/A
SSH 35 35.00%

```

|        |           |        |
|--------|-----------|--------|
| Telnet | 35        | 35.00% |
| Xlates | 91749     | N/A    |
| All    | unlimited |        |

Table 5-3 shows each field description.

**Table 5-3** *show resource allocation Fields*

| Field      | Description                                                                                                                                                                                                                                                                              |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Resource   | The name of the resource that you can limit.                                                                                                                                                                                                                                             |
| Total      | The total amount of the resource that is allocated across all contexts. The amount is an absolute number of concurrent instances or instances per second. If you specified a percentage in the class definition, the ASA converts the percentage to an absolute number for this display. |
| % of Avail | The percentage of the total system resources that is allocated across all contexts, if the resource has a hard system limit. If a resource does not have a system limit, this column shows N/A.                                                                                          |

The following is sample output from the **show resource allocation detail** command:

```

hostname# show resource allocation detail
Resource Origin:

Table 5-4 shows each field description.

**Table 5-4** *show resource allocation detail Fields*

| Field      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Resource   | The name of the resource that you can limit.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Class      | The name of each class, including the default class.<br>The All contexts field shows the total values across all classes.                                                                                                                                                                                                                                                                                                                                                     |
| Mmbrs      | The number of contexts assigned to each class.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Origin     | The origin of the resource limit, as follows: <ul style="list-style-type: none"> <li>A—You set this limit with the <b>all</b> option, instead of as an individual resource.</li> <li>C—This limit is derived from the member class.</li> <li>D—This limit was not defined in the member class, but was derived from the default class. For a context assigned to the default class, the value will be “C” instead of “D.”</li> </ul> The ASA can combine “A” with “C” or “D.” |
| Limit      | The limit of the resource per context, as an absolute number. If you specified a percentage in the class definition, the ASA converts the percentage to an absolute number for this display.                                                                                                                                                                                                                                                                                  |
| Total      | The total amount of the resource that is allocated across all contexts in the class. The amount is an absolute number of concurrent instances or instances per second. If the resource is unlimited, this display is blank.                                                                                                                                                                                                                                                   |
| % of Avail | The percentage of the total system resources that is allocated across all contexts in the class. If the resource is unlimited, this display is blank. If the resource does not have a system limit, then this column shows N/A.                                                                                                                                                                                                                                               |

## Viewing Resource Usage

From the system execution space, you can view the resource usage for each context and display the system resource usage.

From the system execution space, view the resource usage for each context by entering the following command:

| Command                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>show resource usage [context context_name   top n   all   summary   system] [resource {resource_name   all}   detail] [counter counter_name [count_threshold]]</pre> | <p>By default, <b>all</b> context usage is displayed; each context is listed separately.</p> <p>Enter the <b>top n</b> keyword to show the contexts that are the top <i>n</i> users of the specified resource. You must specify a single resource type, and not <b>resource all</b>, with this option.</p> <p>The <b>summary</b> option shows all context usage combined.</p> <p>The <b>system</b> option shows all context usage combined, but shows the system limits for resources instead of the combined context limits.</p> <p>For the <b>resource resource_name</b>, see <a href="#">Table 5-1</a> for available resource names. See also the <b>show resource type</b> command. Specify <b>all</b> (the default) for all types.</p> <p>The <b>detail</b> option shows the resource usage of all resources, including those you cannot manage. For example, you can view the number of TCP intercepts.</p> <p>The <b>counter counter_name</b> is one of the following keywords:</p> <ul style="list-style-type: none"> <li>• <b>current</b>—Shows the active concurrent instances or the current rate of the resource.</li> <li>• <b>denied</b>—Shows the number of instances that were denied because they exceeded the resource limit shown in the Limit column.</li> <li>• <b>peak</b>—Shows the peak concurrent instances, or the peak rate of the resource since the statistics were last cleared, either using the <b>clear resource usage</b> command or because the device rebooted.</li> <li>• <b>all</b>—(Default) Shows all statistics.</li> </ul> <p>The <i>count_threshold</i> sets the number above which resources are shown. The default is 1. If the usage of the resource is below the number you set, then the resource is not shown. If you specify <b>all</b> for the counter name, then the <i>count_threshold</i> applies to the current usage.</p> <p><b>Note</b> To show all resources, set the <i>count_threshold</i> to <b>0</b>.</p> |

The following is sample output from the **show resource usage context** command, which shows the resource usage for the admin context:

```
hostname# show resource usage context admin
```

| Resource | Current | Peak | Limit | Denied | Context |
|----------|---------|------|-------|--------|---------|
| Telnet   | 1       | 1    | 5     | 0      | admin   |
| Conns    | 44      | 55   | N/A   | 0      | admin   |
| Hosts    | 45      | 56   | N/A   | 0      | admin   |

The following is sample output from the **show resource usage summary** command, which shows the resource usage for all contexts and all resources. This sample shows the limits for 6 contexts.

```
hostname# show resource usage summary
```

| Resource        | Current | Peak | Limit      | Denied | Context |
|-----------------|---------|------|------------|--------|---------|
| Syslogs [rate]  | 1743    | 2132 | N/A        | 0      | Summary |
| Conns           | 584     | 763  | 280000 (S) | 0      | Summary |
| Xlates          | 8526    | 8966 | N/A        | 0      | Summary |
| Hosts           | 254     | 254  | N/A        | 0      | Summary |
| Conns [rate]    | 270     | 535  | N/A        | 1704   | Summary |
| Inspects [rate] | 270     | 535  | N/A        | 0      | Summary |

S = System: Combined context limits exceed the system limit; the system limit is shown.

The following is sample output from the **show resource usage summary** command, which shows the limits for 25 contexts. Because the context limit for Telnet and SSH connections is 5 per context, then the combined limit is 125. The system limit is only 100, so the system limit is shown.

```
hostname# show resource usage summary
```

| Resource | Current | Peak | Limit   | Denied | Context |
|----------|---------|------|---------|--------|---------|
| Telnet   | 1       | 1    | 100 [S] | 0      | Summary |
| SSH      | 2       | 2    | 100 [S] | 0      | Summary |
| Conns    | 56      | 90   | N/A     | 0      | Summary |
| Hosts    | 89      | 102  | N/A     | 0      | Summary |

S = System: Combined context limits exceed the system limit; the system limit is shown.

The following is sample output from the **show resource usage system** command, which shows the resource usage for all contexts, but it shows the system limit instead of the combined context limits. The **counter all 0** option is used to show resources that are not currently in use. The Denied statistics indicate how many times the resource was denied due to the system limit, if available.

```
hostname# show resource usage system counter all 0
```

| Resource        | Current | Peak | Limit  | Denied | Context |
|-----------------|---------|------|--------|--------|---------|
| Telnet          | 0       | 0    | 100    | 0      | System  |
| SSH             | 0       | 0    | 100    | 0      | System  |
| ASDM            | 0       | 0    | 32     | 0      | System  |
| Syslogs [rate]  | 1       | 18   | N/A    | 0      | System  |
| Conns           | 0       | 1    | 280000 | 0      | System  |
| Xlates          | 0       | 0    | N/A    | 0      | System  |
| Hosts           | 0       | 2    | N/A    | 0      | System  |
| Conns [rate]    | 1       | 1    | N/A    | 0      | System  |
| Inspects [rate] | 0       | 0    | N/A    | 0      | System  |

## Monitoring SYN Attacks in Contexts

The ASA prevents SYN attacks using TCP Intercept. TCP Intercept uses the SYN cookies algorithm to prevent TCP SYN-flooding attacks. A SYN-flooding attack consists of a series of SYN packets usually originating from spoofed IP addresses. The constant flood of SYN packets keeps the server SYN queue full, which prevents it from servicing connection requests. When the embryonic connection threshold of a connection is crossed, the ASA acts as a proxy for the server and generates a SYN-ACK response to the client SYN request. When the ASA receives an ACK back from the client, it can then authenticate the client and allow the connection to the server.

Monitor SYN attacks using the following commands:

| Command                                   | Purpose                                                                               |
|-------------------------------------------|---------------------------------------------------------------------------------------|
| <b>show perfmon</b>                       | Monitors the rate of attacks for individual contexts.                                 |
| <b>show resource usage detail</b>         | Monitors the amount of resources being used by TCP intercept for individual contexts. |
| <b>show resource usage summary detail</b> | Monitors the resources being used by TCP intercept for the entire system.             |

The following is sample output from the **show perfmon** command that shows the rate of TCP intercepts for a context called admin.

```
hostname/admin# show perfmon

Context:admin
PERFMON STATS: Current Average
Xlates 0/s 0/s
Connections 0/s 0/s
TCP Conns 0/s 0/s
UDP Conns 0/s 0/s
URL Access 0/s 0/s
URL Server Req 0/s 0/s
WebSns Req 0/s 0/s
TCP Fixup 0/s 0/s
HTTP Fixup 0/s 0/s
FTP Fixup 0/s 0/s
AAA Authen 0/s 0/s
AAA Author 0/s 0/s
AAA Account 0/s 0/s
TCP Intercept 322779/s 322779/s
```

The following is sample output from the **show resource usage detail** command that shows the amount of resources being used by TCP Intercept for individual contexts. (Sample text in *italics* shows the TCP intercept information.)

```
hostname(config)# show resource usage detail

## Viewing Assigned MAC Addresses

You can view auto-generated MAC addresses within the system configuration or within the context. This section includes the following topics:

- [Viewing MAC Addresses in the System Configuration, page 5-36](#)
- [Viewing MAC Addresses Within a Context, page 5-37](#)

## Viewing MAC Addresses in the System Configuration

This section describes how to view MAC addresses in the system configuration.

### Guidelines

If you manually assign a MAC address to an interface, but also have auto-generation enabled, the auto-generated address continues to show in the configuration even though the manual MAC address is the one that is in use. If you later remove the manual MAC address, the auto-generated one shown will be used.

### Detailed Steps

| Command                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>show running-config all context [name]</code> | Shows the assigned MAC addresses from the system execution space.<br><br>The <b>all</b> option is required to view the assigned MAC addresses. Although this command is user-configurable in global configuration mode only, the <b>mac-address auto</b> command appears as a read-only entry in the configuration for each context along with the assigned MAC address. Only allocated interfaces that are configured with a <b>nameif</b> command within the context have a MAC address assigned. |

### Examples

The following output from the **show running-config all context admin** command shows the primary and standby MAC address assigned to the Management0/0 interface:

```
hostname# show running-config all context admin

context admin
 allocate-interface Management0/0
 mac-address auto Management0/0 a24d.0000.1440 a24d.0000.1441
 config-url disk0:/admin.cfg
```

The following output from the **show running-config all context** command shows all the MAC addresses (primary and standby) for all context interfaces. Note that because the GigabitEthernet0/0 and GigabitEthernet0/1 main interfaces are not configured with a **nameif** command inside the contexts, no MAC addresses have been generated for them.

```
hostname# show running-config all context

admin-context admin
context admin
 allocate-interface Management0/0
 mac-address auto Management0/0 a2d2.0400.125a a2d2.0400.125b
 config-url disk0:/admin.cfg
!

context CTX1
 allocate-interface GigabitEthernet0/0
 allocate-interface GigabitEthernet0/0.1-GigabitEthernet0/0.5
 mac-address auto GigabitEthernet0/0.1 a2d2.0400.11bc a2d2.0400.11bd
 mac-address auto GigabitEthernet0/0.2 a2d2.0400.11c0 a2d2.0400.11c1
 mac-address auto GigabitEthernet0/0.3 a2d2.0400.11c4 a2d2.0400.11c5
 mac-address auto GigabitEthernet0/0.4 a2d2.0400.11c8 a2d2.0400.11c9
```

```

mac-address auto GigabitEthernet0/0.5 a2d2.0400.11cc a2d2.0400.11cd
allocate-interface GigabitEthernet0/1
allocate-interface GigabitEthernet0/1.1-GigabitEthernet0/1.3
mac-address auto GigabitEthernet0/1.1 a2d2.0400.120c a2d2.0400.120d
mac-address auto GigabitEthernet0/1.2 a2d2.0400.1210 a2d2.0400.1211
mac-address auto GigabitEthernet0/1.3 a2d2.0400.1214 a2d2.0400.1215
config-url disk0:/CTX1.cfg
!

context CTX2
allocate-interface GigabitEthernet0/0
allocate-interface GigabitEthernet0/0.1-GigabitEthernet0/0.5

mac-address auto GigabitEthernet0/1.3 a2d2.0400.1212 a2d2.0400.1213
config-url disk0:/CTX2.cfg
!
```

## Viewing MAC Addresses Within a Context

This section describes how to view MAC addresses within a context.

### Detailed Steps

| Command                                             | Purpose                                                            |
|-----------------------------------------------------|--------------------------------------------------------------------|
| <b>show interface   include (Interface)   (MAC)</b> | Shows the MAC address in use by each interface within the context. |

### Examples

For example:

```

hostname/context# show interface | include (Interface) | (MAC)

Interface GigabitEthernet1/1.1 "g1/1.1", is down, line protocol is down
MAC address a201.0101.0600, MTU 1500
Interface GigabitEthernet1/1.2 "g1/1.2", is down, line protocol is down
MAC address a201.0102.0600, MTU 1500
Interface GigabitEthernet1/1.3 "g1/1.3", is down, line protocol is down
MAC address a201.0103.0600, MTU 1500
...
```

#### Note

The **show interface** command shows the MAC address in use; if you manually assign a MAC address and also have auto-generation enabled, then you can only view the unused auto-generated address from within the system configuration.

# Configuration Examples for Multiple Context Mode

The following example:

- Automatically sets the MAC addresses in contexts.
- Sets the default class limit for conns to 10 percent instead of unlimited.
- Creates a gold resource class.
- Sets the admin context to be “administrator.”
- Creates a context called “administrator” on the internal flash memory to be part of the default resource class.
- Adds two contexts from an FTP server as part of the gold resource class.

```
hostname(config)# mac-address auto prefix 19
```

```
hostname(config)# class default
```

```
hostname(config-class)# limit-resource conns 10%
```

```
hostname(config)# class gold
```

```
hostname(config-class)# limit-resource mac-addresses 10000
```

```
hostname(config-class)# limit-resource conns 15%
```

```
hostname(config-class)# limit-resource rate conns 1000
```

```
hostname(config-class)# limit-resource rate inspects 500
```

```
hostname(config-class)# limit-resource hosts 9000
```

```
hostname(config-class)# limit-resource asdm 5
```

```
hostname(config-class)# limit-resource ssh 5
```

```
hostname(config-class)# limit-resource rate syslogs 5000
```

```
hostname(config-class)# limit-resource telnet 5
```

```
hostname(config-class)# limit-resource xlates 36000
```

```
hostname(config)# admin-context administrator
```

```
hostname(config)# context administrator
```

```
hostname(config-ctx)# allocate-interface gigabitethernet0/0.1
```

```
hostname(config-ctx)# allocate-interface gigabitethernet0/1.1
```

```
hostname(config-ctx)# config-url flash:/admin.cfg
```

```
hostname(config-ctx)# context test
```

```
hostname(config-ctx)# allocate-interface gigabitethernet0/0.100 int1
```

```
hostname(config-ctx)# allocate-interface gigabitethernet0/0.102 int2
```

```
hostname(config-ctx)# allocate-interface gigabitethernet0/0.110-gigabitethernet0/0.115
int3-int8
```

```
hostname(config-ctx)# config-url ftp://user1:passwd@10.1.1.1/configlets/test.cfg
```

```
hostname(config-ctx)# member gold
```

```
hostname(config-ctx)# context sample
```

```
hostname(config-ctx)# allocate-interface gigabitethernet0/1.200 int1
```

```
hostname(config-ctx)# allocate-interface gigabitethernet0/1.212 int2
```

```
hostname(config-ctx)# allocate-interface gigabitethernet0/1.230-gigabitethernet0/1.235
int3-int8
```

```
hostname(config-ctx)# config-url ftp://user1:passwd@10.1.1.1/configlets/sample.cfg
```

```
hostname(config-ctx)# member gold
```

# Feature History for Multiple Context Mode

Table 5-5 lists each feature change and the platform release in which it was implemented.

**Table 5-5**      *Feature History for Multiple Context Mode*

| Feature Name                                         | Platform Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Multiple security contexts                           | 7.0(1)            | Multiple context mode was introduced.<br><br>We introduced the following commands: <b>context</b> , <b>mode</b> , and <b>class</b> .                                                                                                                                                                                                                                                                                                                                                             |
| Automatic MAC address assignment                     | 7.2(1)            | Automatic assignment of MAC address to context interfaces was introduced.<br><br>We introduced the following command: <b>mac-address auto</b> .                                                                                                                                                                                                                                                                                                                                                  |
| Resource management                                  | 7.2(1)            | Resource management was introduced.<br><br>We introduced the following commands: <b>class</b> , <b>limit-resource</b> , and <b>member</b> .                                                                                                                                                                                                                                                                                                                                                      |
| Virtual sensors for IPS                              | 8.0(2)            | The AIP SSM running IPS software Version 6.0 and above can run multiple virtual sensors, which means you can configure multiple security policies on the AIP SSM. You can assign each context or single mode ASA to one or more virtual sensors, or you can assign multiple security contexts to the same virtual sensor.<br><br>We introduced the following command: <b>allocate-ips</b> .                                                                                                      |
| Automatic MAC address assignment enhancements        | 8.0(5)/8.2(2)     | The MAC address format was changed to use a prefix, to use a fixed starting value (A2), and to use a different scheme for the primary and secondary unit MAC addresses in a failover pair. The MAC addresses are also now persistent across reloads. The command parser now checks if auto-generation is enabled; if you want to also manually assign a MAC address, you cannot start the manual MAC address with A2.<br><br>We modified the following command: <b>mac-address auto prefix</b> . |
| Maximum contexts increased for the ASA 5550 and 5580 | 8.4(1)            | The maximum security contexts for the ASA 5550 was increased from 50 to 100. The maximum for the ASA 5580 was increased from 50 to 250.                                                                                                                                                                                                                                                                                                                                                          |

## **PART 3**

### **Configuring Interfaces**

# CHAPTER 6

## Starting Interface Configuration (ASA 5510 and Higher)

---

This chapter includes tasks for starting your interface configuration for the ASA 5510 and higher, including configuring Ethernet settings, redundant interfaces, and EtherChannels.

### Note

For ASA 5505 configuration, see [Chapter 7, “Starting Interface Configuration \(ASA 5505\).”](#)

For multiple context mode, complete all tasks in this section in the system execution space. To change from the context to the system execution space, enter the **changeto system** command.

---

This chapter includes the following sections:

- [Information About Starting ASA 5510 and Higher Interface Configuration, page 6-1](#)
- [Licensing Requirements for ASA 5510 and Higher Interfaces, page 6-7](#)
- [Guidelines and Limitations, page 6-8](#)
- [Default Settings, page 6-10](#)
- [Starting Interface Configuration \(ASA 5510 and Higher\), page 6-10](#)
- [Monitoring Interfaces, page 6-32](#)
- [Configuration Examples for ASA 5510 and Higher Interfaces, page 6-32](#)
- [Where to Go Next, page 6-33](#)
- [Feature History for ASA 5510 and Higher Interfaces, page 6-34](#)

## Information About Starting ASA 5510 and Higher Interface Configuration

This section includes the following topics:

- [Auto-MDI/MDIX Feature, page 6-2](#)
- [Interfaces in Transparent Mode, page 6-2](#)
- [Management Interface, page 6-2](#)
- [Redundant Interfaces, page 6-4](#)
- [EtherChannels, page 6-4](#)

## Auto-MDI/MDIX Feature

For RJ-45 interfaces on the ASA 5500 series, the default auto-negotiation setting also includes the Auto-MDI/MDIX feature. Auto-MDI/MDIX eliminates the need for crossover cabling by performing an internal crossover when a straight cable is detected during the auto-negotiation phase. Either the speed or duplex must be set to auto-negotiate to enable Auto-MDI/MDIX for the interface. If you explicitly set both the speed and duplex to a fixed value, thus disabling auto-negotiation for both settings, then Auto-MDI/MDIX is also disabled. For Gigabit Ethernet, when the speed and duplex are set to 1000 and full, then the interface always auto-negotiates; therefore Auto-MDI/MDIX is always enabled and you cannot disable it.

## Interfaces in Transparent Mode

Interfaces in transparent mode belong to a “bridge group,” one bridge group for each network. You can have up to eight bridge groups of four interfaces each per context or in single mode. For more information about bridge groups, see the [“Bridge Groups in Transparent Mode”](#) section on page 9-1.

## Management Interface

- [Management Interface Overview](#), page 6-2
- [Management Slot/Port Interface](#), page 6-2
- [Using Any Interface for Management-Only Traffic](#), page 6-3
- [Management Interface for Transparent Mode](#), page 6-3
- [No Support for Redundant Management Interfaces](#), page 6-4

## Management Interface Overview

You can manage the ASA by connecting to:

- Any through-traffic interface
- A dedicated Management *Slot/Port* interface (if available for your model)

You may need to configure management access to the interface according to [Chapter 37, “Configuring Management Access.”](#)

## Management *Slot/Port* Interface

[Table 6-1](#) shows the Management interfaces per model.-

**Table 6-1 Management Interfaces Per Model**

| Model    | Configurable for Through Traffic <sup>1</sup> | Management 0/0 <sup>2</sup> | Management 0/1 | Management 1/0 | Management 1/1 |
|----------|-----------------------------------------------|-----------------------------|----------------|----------------|----------------|
| ASA 5505 | N/A                                           | No                          | No             | No             | No             |
| ASA 5510 | Yes                                           | Yes                         | No             | No             | No             |
| ASA 5520 | Yes                                           | Yes                         | No             | No             | No             |

**Table 6-1 Management Interfaces Per Model**

| Model      | Configurable for Through Traffic <sup>1</sup> | Management 0/0 <sup>2</sup> | Management 0/1 | Management 1/0   | Management 1/1   |
|------------|-----------------------------------------------|-----------------------------|----------------|------------------|------------------|
| ASA 5540   | Yes                                           | Yes                         | No             | No               | No               |
| ASA 5550   | Yes                                           | Yes                         | No             | No               | No               |
| ASA 5580   | Yes                                           | Yes                         | Yes            | No               | No               |
| ASA 5585-X | Yes                                           | Yes                         | Yes            | Yes <sup>3</sup> | Yes <sup>3</sup> |

1. By default, the Management 0/0 interface is configured for management-only traffic (the **management-only** command). For supported models in routed mode, you can remove the limitation and pass through traffic. If your model includes additional Management interfaces, you can use them for through traffic as well. The Management interfaces might not be optimized for through-traffic, however.
2. The Management 0/0 interface is configured for ASDM access as part of the default factory configuration. See the [“Factory Default Configurations” section on page 2-10](#) for more information.
3. If you installed an SSP in slot 1, then Management 1/0 and 1/1 provide management access to the SSP in slot 1 only.

**Note**

If you installed an IPS module, then the IPS module management interface(s) provides management access for the IPS module only.

## Using Any Interface for Management-Only Traffic

You can use any interface as a dedicated management-only interface by configuring it for management traffic, including an EtherChannel interface (see the **management-only** command).

## Management Interface for Transparent Mode

In transparent firewall mode, in addition to the maximum allowed through-traffic interfaces, you can also use the Management interface (either the physical interface, a subinterface (if supported for your model), or an EtherChannel interface comprised of Management interfaces (if you have multiple Management interfaces)) as a separate management interface. You cannot use any other interface types as management interfaces.

If your model does not include a Management interface, you must manage the transparent firewall from a data interface.

In multiple context mode, you cannot share any interfaces, including the Management interface, across contexts. To provide management per context, you can create subinterfaces of the Management interface and allocate a Management subinterface to each context.

For 8.4(1) and later, the management interface is not part of a normal bridge group. Note that for operational purposes, it is part of a non-configurable bridge group.

**Note**

In transparent firewall mode, the management interface updates the MAC address table in the same manner as a data interface; therefore you should not connect both a management and a data interface to the same switch unless you configure one of the switch ports as a routed port (by default Cisco Catalyst switches share a MAC address for all VLAN switch ports). Otherwise, if traffic arrives on the management interface from the physically-connected switch, then the ASA updates the MAC address table to use the *management* interface to access the switch, instead of the data interface. This action causes a temporary traffic interruption; the ASA will not re-update the MAC address table for packets from the switch to the data interface for at least 30 seconds for security reasons.

## No Support for Redundant Management Interfaces

Redundant interfaces do not support Management *slot/port* interfaces as members. You also cannot set a redundant interface comprised of non-Management interfaces as management-only.

## Redundant Interfaces

A logical redundant interface consists of a pair of physical interfaces: an active and a standby interface. When the active interface fails, the standby interface becomes active and starts passing traffic. You can configure a redundant interface to increase the ASA reliability. This feature is separate from device-level failover, but you can configure redundant interfaces as well as device-level failover if desired.

### Redundant Interface MAC Address

The redundant interface uses the MAC address of the first physical interface that you add. If you change the order of the member interfaces in the configuration, then the MAC address changes to match the MAC address of the interface that is now listed first. Alternatively, you can assign a MAC address to the redundant interface, which is used regardless of the member interface MAC addresses (see the [“Configuring the MAC Address and MTU” section on page 8-8](#) or the [“Configuring Multiple Contexts” section on page 5-14](#)). When the active interface fails over to the standby, the same MAC address is maintained so that traffic is not disrupted.

## EtherChannels

An 802.3ad EtherChannel is a logical interface (called a port-channel interface) consisting of a bundle of individual Ethernet links (a channel group) so that you increase the bandwidth for a single network. A port channel interface is used in the same way as a physical interface when you configure interface-related features.

You can configure up to 48 EtherChannels.

This section includes the following topics:

- [Channel Group Interfaces, page 6-4](#)
- [Connecting to an EtherChannel on Another Device, page 6-5](#)
- [Link Aggregation Control Protocol, page 6-6](#)
- [Load Balancing, page 6-6](#)
- [EtherChannel MAC Address, page 6-7](#)

### Channel Group Interfaces

Each channel group can have eight active interfaces. Note that you can assign up to 16 interfaces to a channel group. While only eight interfaces can be active, the remaining interfaces can act as standby links in case of interface failure.

All interfaces in the channel group must be the same type and speed. The first interface added to the channel group determines the correct type and speed.

The EtherChannel aggregates the traffic across all the available active interfaces in the channel. The port is selected using a proprietary hash algorithm, based on source or destination MAC addresses, IP addresses, TCP and UDP port numbers and vlan numbers.

## Connecting to an EtherChannel on Another Device

The device to which you connect the ASA EtherChannel must also support 802.3ad EtherChannels; for example, you can connect to the Catalyst 6500 switch.

When the switch is part of a Virtual Switching System (VSS), then you can connect ASA interfaces within the same EtherChannel to separate switches in the VSS. The switch interfaces are members of the same EtherChannel port-channel interface, because the separate switches act like a single switch (see [Figure 6-1](#)).

**Figure 6-1** Connecting to a VSS

If you use the ASA in an Active/Standby failover deployment, then you need to create separate EtherChannels on the switches in the VSS, one for each ASA (see [Figure 6-1](#)). On each ASA, a single EtherChannel connects to both switches. Even if you could group all switch interfaces into a single EtherChannel connecting to both ASAs (in this case, the EtherChannel will not be established because of the separate ASA system IDs), a single EtherChannel would not be desirable because you do not want traffic sent to the standby ASA.

**Figure 6-2** Active/Standby Failover and VSS

## Link Aggregation Control Protocol

The Link Aggregation Control Protocol (LACP) aggregates interfaces by exchanging the Link Aggregation Control Protocol Data Units (LACPDUs) between two network devices.

You can configure each physical interface in an EtherChannel to be:

- **Active**—Sends and receives LACP updates. An active EtherChannel can establish connectivity with either an active or a passive EtherChannel. You should use the active mode unless you need to minimize the amount of LACP traffic.
- **Passive**—Receives LACP updates. A passive EtherChannel can only establish connectivity with an active EtherChannel.
- **On**—The EtherChannel is always on, and LACP is not used. An “on” EtherChannel can only establish a connection with another “on” EtherChannel.

LACP coordinates the automatic addition and deletion of links to the EtherChannel without user intervention. It also handles misconfigurations and checks that both ends of member interfaces are connected to the correct channel group. “On” mode cannot use standby interfaces in the channel group when an interface goes down, and the connectivity and configurations are not checked.

## Load Balancing

The ASA distributes packets to the interfaces in the EtherChannel by hashing the source and destination IP address of the packet (this criteria is configurable; see the [“Customizing the EtherChannel” section on page 6-28](#)). The hash result is a 3-bit value (0 to 7).

The eight hash result values are distributed in a round robin fashion between the channel group interfaces, starting with the interface with the lowest ID (slot/port). For example, all packets with a hash result of 0 go to GigabitEthernet 0/0, packets with a hash result of 1 go to GigabitEthernet 0/1, packets with a hash result of 2 go to GigabitEthernet 0/2, and so on.

Because there are eight hash result values regardless of how many active interfaces are in the EtherChannel, packets might not be distributed evenly depending on the number of active interfaces.

[Table 6-2](#) shows the load balancing amounts per interface for each number of active interfaces. The active interfaces in **bold** have even distribution.

**Table 6-2 Load Distribution per Interface**

| # of Active Interfaces | % Distribution Per Interface |              |              |              |              |              |              |              |
|------------------------|------------------------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|
|                        | 1                            | 2            | 3            | 4            | 5            | 6            | 7            | 8            |
| 1                      | <b>100%</b>                  | —            | —            | —            | —            | —            | —            | —            |
| 2                      | <b>50%</b>                   | <b>50%</b>   | —            | —            | —            | —            | —            | —            |
| 3                      | 37.5%                        | 37.5%        | 25%          | —            | —            | —            | —            | —            |
| 4                      | <b>25%</b>                   | <b>25%</b>   | <b>25%</b>   | <b>25%</b>   | —            | —            | —            | —            |
| 5                      | 25%                          | 25%          | 25%          | 12.5%        | 12.5%        | —            | —            | —            |
| 6                      | 25%                          | 25%          | 12.5%        | 12.5%        | 12.5%        | 12.5%        | —            | —            |
| 7                      | 25%                          | 12.5%        | 12.5%        | 12.5%        | 12.5%        | 12.5%        | 12.5%        | —            |
| 8                      | <b>12.5%</b>                 | <b>12.5%</b> | <b>12.5%</b> | <b>12.5%</b> | <b>12.5%</b> | <b>12.5%</b> | <b>12.5%</b> | <b>12.5%</b> |

If an active interface goes down and is not replaced by a standby interface, then traffic is rebalanced between the remaining links. The failure is masked from both Spanning Tree at Layer 2 and the routing table at Layer 3, so the switchover is transparent to other network devices.

## EtherChannel MAC Address

All interfaces that are part of the channel group share the same MAC address. This feature makes the EtherChannel transparent to network applications and users, because they only see the one logical connection; they have no knowledge of the individual links.

The port-channel interface uses the lowest numbered channel group interface MAC address as the port-channel MAC address. Alternatively you can manually configure a MAC address for the port-channel interface. In multiple context mode, you can automatically assign unique MAC addresses to interfaces, including an EtherChannel port interface. We recommend manually, or in multiple context mode, automatically configuring a unique MAC address in case the group channel interface membership changes. If you remove the interface that was providing the port-channel MAC address, then the port-channel MAC address changes to the next lowest numbered interface, thus causing traffic disruption.

## Licensing Requirements for ASA 5510 and Higher Interfaces

| Model    | License Requirement                                                                                                                                                                                                                                                                                               |

1. The maximum number of combined interfaces; for example, VLANs, physical, redundant, bridge group, and EtherChannel interfaces.

## Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

### Context Mode Guidelines

In multiple context mode, configure the physical interfaces in the system execution space according to the [“Starting Interface Configuration \(ASA 5510 and Higher\)”](#) section on page 6-10. Then, configure the logical interface parameters in the context execution space according to [Chapter 8, “Completing Interface Configuration \(Routed Mode\),”](#) or [Chapter 9, “Completing Interface Configuration \(Transparent Mode\).”](#)

### Firewall Mode Guidelines

- For transparent mode, you can configure up to eight bridge groups per context or for a single mode device.
- Each bridge group can include up to four interfaces.
- For multiple context, transparent mode, each context must use different interfaces; you cannot share an interface across contexts.

### Failover Guidelines

- When you use a redundant or EtherChannel interface as a failover link, it must be pre-configured on both units in the failover pair; you cannot configure it on the primary unit and expect it to replicate to the secondary unit because *the failover link itself is required for replication*.

- If you use a redundant or EtherChannel interface for the state link, no special configuration is required; the configuration can replicate from the primary unit as normal.
- You can monitor redundant or EtherChannel interfaces for failover using the **monitor-interface** command; be sure to reference the logical redundant interface name. When an active member interface fails over to a standby interface, this activity does not cause the redundant or EtherChannel interface to appear to be failed when being monitored for device-level failover. Only when all physical interfaces fail does the redundant or EtherChannel interface appear to be failed (for an EtherChannel interface, the number of member interfaces allowed to fail is configurable).
- If you use an EtherChannel interface for a failover or state link, then to prevent out-of-order packets, only one interface in the EtherChannel is used. If that interface fails, then the next interface in the EtherChannel is used. You cannot alter the EtherChannel configuration while it is in use as a failover link. To alter the configuration, you need to either shut down the EtherChannel while you make changes, or temporarily disable failover; either action prevents failover from occurring for the duration.

#### Redundant Interface Guidelines

- You can configure up to 8 redundant interface pairs.
- All ASA configuration refers to the logical redundant interface instead of the member physical interfaces.
- You cannot use a redundant interface as part of an EtherChannel, nor can you use an EtherChannel as part of a redundant interface. You cannot use the same physical interfaces in a redundant interface and an EtherChannel interface. You can, however, configure both types on the ASA if they do not use the same physical interfaces.
- If you shut down the active interface, then the standby interface becomes active.
- Redundant interfaces do not support Management *slot/port* interfaces as members. You also cannot set a redundant interface comprised of non-Management interfaces as management-only.
- For failover guidelines, see the [“Failover Guidelines” section on page 6-8](#).

#### EtherChannel Guidelines

- You can configure up to 48 EtherChannels.
- Each channel group can have eight active interfaces. Note that you can assign up to 16 interfaces to a channel group. While only eight interfaces can be active, the remaining interfaces can act as standby links in case of interface failure.
- All interfaces in the channel group must be the same type and speed. The first interface added to the channel group determines the correct type and speed.
- The device to which you connect the ASA 5500 EtherChannel must also support 802.3ad EtherChannels; for example, you can connect to the Catalyst 6500 switch.
- All ASA configuration refers to the logical EtherChannel interface instead of the member physical interfaces.
- You cannot use a redundant interface as part of an EtherChannel, nor can you use an EtherChannel as part of a redundant interface. You cannot use the same physical interfaces in a redundant interface and an EtherChannel interface. You can, however, configure both types on the ASA if they do not use the same physical interfaces.
- You cannot use interfaces on the 4GE SSM, including the integrated 4GE SSM in slot 1 on the ASA 5550, as part of an EtherChannel.
- For failover guidelines, see the [“Failover Guidelines” section on page 6-8](#).

## Default Settings

This section lists default settings for interfaces if you do not have a factory default configuration. For information about the factory default configurations, see the [“Factory Default Configurations” section on page 2-10](#).

### Default State of Interfaces

The default state of an interface depends on the type and the context mode.

In multiple context mode, all allocated interfaces are enabled by default, no matter what the state of the interface is in the system execution space. However, for traffic to pass through the interface, the interface also has to be enabled in the system execution space. If you shut down an interface in the system execution space, then that interface is down in all contexts that share it.

In single mode or in the system execution space, interfaces have the following default states:

- Physical interfaces—Disabled.
- Redundant Interfaces—Enabled. However, for traffic to pass through the redundant interface, the member physical interfaces must also be enabled.
- Subinterfaces—Enabled. However, for traffic to pass through the subinterface, the physical interface must also be enabled.
- EtherChannel port-channel interfaces—Enabled. However, for traffic to pass through the EtherChannel, the channel group physical interfaces must also be enabled.

### Default Speed and Duplex

- By default, the speed and duplex for copper (RJ-45) interfaces are set to auto-negotiate.
- The fiber interface for the ASA 5550 (slot 1) and the 4GE SSM has a fixed speed and does not support duplex, but you can set the interface to negotiate link parameters (the default) or not to negotiate.
- For fiber interfaces for the ASA 5580 and 5585-X, the speed is set for automatic link negotiation.

### Default Connector Type

The ASA 5550 (slot 1) and the 4GE SSM for the ASA 5510 and higher ASA include two connector types: copper RJ-45 and fiber SFP. RJ-45 is the default. You can configure the ASA to use the fiber SFP connectors.

### Default MAC Addresses

By default, the physical interface uses the burned-in MAC address, and all subinterfaces of a physical interface use the same burned-in MAC address.

## Starting Interface Configuration (ASA 5510 and Higher)

This section includes the following topics:

- [Task Flow for Starting Interface Configuration, page 6-11](#)
- [Converting In-Use Interfaces to a Redundant or EtherChannel Interface, page 6-12](#)
- [Enabling the Physical Interface and Configuring Ethernet Parameters, page 6-21](#)
- [Configuring a Redundant Interface, page 6-24](#)

- [Configuring an EtherChannel, page 6-26](#)
- [Configuring VLAN Subinterfaces and 802.1Q Trunking, page 6-29](#)
- [Enabling Jumbo Frame Support \(Supported Models\), page 6-31](#)

## Task Flow for Starting Interface Configuration

### Note

If you have an existing configuration, and want to convert interfaces that are in use to a redundant or EtherChannel interface, perform your configuration offline to minimize disruption. See the [“Converting In-Use Interfaces to a Redundant or EtherChannel Interface”](#) section on page 6-12.

To start configuring interfaces, perform the following steps:

- Step 1** (Multiple context mode) Complete all tasks in this section in the system execution space. To change from the context to the system execution space, enter the **changeto system** command.
- Step 2** Enable the physical interface, and optionally change Ethernet parameters. See the [“Enabling the Physical Interface and Configuring Ethernet Parameters”](#) section on page 6-21.
- Physical interfaces are disabled by default.
- Step 3** (Optional) Configure redundant interface pairs. See the [“Configuring a Redundant Interface”](#) section on page 6-24.
- A logical redundant interface pairs an active and a standby physical interface. When the active interface fails, the standby interface becomes active and starts passing traffic.
- Step 4** (Optional) Configure an EtherChannel. See the [“Configuring an EtherChannel”](#) section on page 6-26.
- An EtherChannel groups multiple Ethernet interfaces into a single logical interface.

### Note

You cannot use interfaces on the 4GE SSM, including the integrated 4GE SSM in slot 1 on the ASA 5550, as part of an EtherChannel.

- Step 5** (Optional) Configure VLAN subinterfaces. See the [“Configuring VLAN Subinterfaces and 802.1Q Trunking”](#) section on page 6-29.
- Step 6** (Optional) Enable jumbo frame support on the ASA 5580 and 5585-X according to the [“Enabling Jumbo Frame Support \(Supported Models\)”](#) section on page 6-31.
- Step 7** (Multiple context mode only) To complete the configuration of interfaces in the system execution space, perform the following tasks that are documented in [Chapter 5, “Configuring Multiple Context Mode”](#):
- To assign interfaces to contexts, see the [“Configuring a Security Context”](#) section on page 5-18.
  - (Optional) To automatically assign unique MAC addresses to context interfaces, see the [“Automatically Assigning MAC Addresses to Context Interfaces”](#) section on page 5-23.

The MAC address is used to classify packets within a context. If you share an interface, but do not have unique MAC addresses for the interface in each context, then the destination IP address is used to classify packets. Alternatively, you can manually assign MAC addresses within the context according to the [“Configuring the MAC Address and MTU”](#) section on page 8-8.

- Step 8** Complete the interface configuration according to [Chapter 8, “Completing Interface Configuration \(Routed Mode\),”](#) or [Chapter 9, “Completing Interface Configuration \(Transparent Mode\).”](#)
- 

## Converting In-Use Interfaces to a Redundant or EtherChannel Interface

If you have an existing configuration and want to take advantage of the redundant or EtherChannel interface feature for interfaces that are currently in use, you will have some amount of downtime when you convert to the logical interfaces.

This section provides an overview of how to convert your existing interfaces to a redundant or EtherChannel interface with minimal downtime. See the [“Configuring a Redundant Interface” section on page 6-24](#) and the [“Configuring an EtherChannel” section on page 6-26](#) for more information.

- [Detailed Steps \(Single Mode\), page 6-12](#)
- [Detailed Steps \(Multiple Mode\), page 6-17](#)

### Detailed Steps (Single Mode)

We recommend that you update your configuration offline as a text file, and reimport the whole configuration for the following reasons:

- Because you cannot add a named interface as a member of a redundant or EtherChannel interface, you must remove the name from the interface. When you remove the name from the interface, any command that referred to that name is deleted. Because commands that refer to interface names are widespread throughout the configuration and affect multiple features, removing a name from an in-use interface at the CLI or in ASDM would cause significant damage to your configuration, not to mention significant downtime while you reconfigure all your features around a new interface name.
- Changing your configuration offline lets you use the same interface names for your new logical interfaces, so you do not need to touch the feature configurations that refer to interface names. You only need to change the interface configuration.
- Clearing the running configuration and immediately applying a new configuration will minimize the downtime of your interfaces. You will not be waiting to configure the interfaces in real time.

- 
- Step 1** Connect to the ASA; if you are using failover, connect to the active ASA.
- Step 2** If you are using failover, disable failover by entering the **no failover** command.
- Step 3** Copy the running configuration by entering the **more system:running-config** command and copying the display output to a text editor.
- Be sure to save an extra copy of the old configuration in case you make an error when you edit it.
- Step 4** For each in-use interface that you want to add to a redundant or EtherChannel interface, cut and paste all commands under the **interface** command to the end of the interface configuration section for use in creating your new logical interfaces. The only exceptions are the following commands, which should stay with the physical interface configuration:
- **media-type**
  - **speed**
  - **duplex**
  - **flowcontrol**

**Note**

You can only add *physical* interfaces to an EtherChannel or redundant interface; you cannot have VLANs configured for the physical interfaces.

Be sure to match the above values for all interfaces in a given EtherChannel or redundant interface. Note that the duplex setting for an EtherChannel interface must be Full or Auto.

For example, you have the following interface configuration. The bolded commands are the ones we want to use with three new EtherChannel interfaces, and that you should cut and paste to the end of the interface section.

```
interface GigabitEthernet0/0
 nameif outside
 security-level 0
 ip address 10.86.194.225 255.255.255.0
 no shutdown
!
interface GigabitEthernet0/1
 nameif inside
 security-level 100
 ip address 192.168.1.3 255.255.255.0
 no shutdown
!
interface GigabitEthernet0/2
 shutdown
 no nameif
 no security-level
 no ip address
!
interface GigabitEthernet0/3
 shutdown
 no nameif
 no security-level
 no ip address
!
interface GigabitEthernet0/4
 shutdown
 no nameif
 no security-level
 no ip address
!
interface GigabitEthernet0/5
 shutdown
 no nameif
 no security-level
 no ip address
!
interface Management0/0
 nameif mgmt
 security-level 100
 ip address 10.1.1.5 255.255.255.0
 no shutdown
!
interface Management0/1
 shutdown
 no nameif
 no security-level
 no ip address
```

**Step 5** Above each pasted command section, create your new logical interfaces by entering one of the following commands:

- **interface redundant** *number* [1-8]
- **interface port-channel** *channel\_id* [1-48]

For example:

...

```
interface port-channel 1
 nameif outside
 security-level 0
 ip address 10.86.194.225 255.255.255.0
 no shutdown
!
interface port-channel 2
 nameif inside
 security-level 100
 ip address 192.168.1.3 255.255.255.0
 no shutdown
!
interface port-channel 3
 nameif mgmt
 security-level 100
 ip address 10.1.1.5 255.255.255.0
 no shutdown
```

**Step 6** Assign the physical interfaces to the new logical interfaces:

- **Redundant interface**—Enter the following commands under the new **interface redundant** command:

```
member-interface physical_interface1
member-interface physical_interface2
```

Where the physical interfaces are any two interfaces of the same type (either formerly in use or unused). You cannot assign a Management interface to a redundant interface.

For example, to take advantage of existing cabling, you would continue to use the formerly in-use interfaces in their old roles as part of the inside and outside redundant interfaces:

```
interface redundant 1
 nameif outside
 security-level 0
 ip address 10.86.194.225 255.255.255.0
 member-interface GigabitEthernet0/0
 member-interface GigabitEthernet0/2

interface redundant 2
 nameif inside
 security-level 100
 ip address 192.168.1.3 255.255.255.0
 member-interface GigabitEthernet0/1
 member-interface GigabitEthernet0/3
```

- **EtherChannel interface**—Enter the following command under each interface you want to add to the EtherChannel (either formerly in use or unused). You can assign up to 16 interfaces per EtherChannel, although only eight can be active; the others are in a standby state in case of failure.

```
channel-group channel_id mode active
```

For example, to take advantage of existing cabling, you would continue to use the formerly in-use interfaces in their old roles as part of the inside and outside EtherChannel interfaces:

```
interface GigabitEthernet0/0
 channel-group 1 mode active
```

```

 no shutdown
 !
interface GigabitEthernet0/1
 channel-group 2 mode active
 no shutdown
 !
interface GigabitEthernet0/2
 channel-group 1 mode active
 shutdown
 no nameif
 no security-level
 no ip address
 !
interface GigabitEthernet0/3
 channel-group 1 mode active
 shutdown
 no nameif
 no security-level
 no ip address
 !
interface GigabitEthernet0/4
 channel-group 2 mode active
 shutdown
 no nameif
 no security-level
 no ip address
 !
interface GigabitEthernet0/5
 channel-group 2 mode active
 shutdown
 no nameif
 no security-level
 no ip address
 !
interface Management0/0
 channel-group 3 mode active
 no shutdown
 !
interface Management0/1
 channel-group 3 mode active
 shutdown
 no nameif
 no security-level
 no ip address
 ...

```

- Step 7** Enable each formerly unused interface that is now part of a logical interface by adding **no** in front of the **shutdown** command.

For example, your final EtherChannel configuration is:

```

interface GigabitEthernet0/0
 channel-group 1 mode active
 no shutdown
 !
interface GigabitEthernet0/1
 channel-group 2 mode active
 no shutdown
 !
interface GigabitEthernet0/2
 channel-group 1 mode active
 no shutdown
 no nameif

```

```

no security-level
no ip address
!
interface GigabitEthernet0/3
channel-group 1 mode active
no shutdown
no nameif
no security-level
no ip address
!
interface GigabitEthernet0/4
channel-group 2 mode active
no shutdown
no nameif
no security-level
no ip address
!
interface GigabitEthernet0/5
channel-group 2 mode active
no shutdown
no nameif
no security-level
no ip address
!
interface Management0/0
channel-group 3 mode active
no shutdown
!
interface Management0/1
channel-group 3 mode active
no shutdown
no nameif
no security-level
no ip address
!
interface port-channel 1
nameif outside
security-level 0
ip address 10.86.194.225 255.255.255.0
!
interface port-channel 2
nameif inside
security-level 100
ip address 192.168.1.3 255.255.255.0
!
interface port-channel 3
nameif mgmt
security-level 100
ip address 10.1.1.5 255.255.255.0

```

**Note**

Other optional EtherChannel parameters can be configured after you import the new configuration. See the [“Configuring an EtherChannel”](#) section on page 6-26.

**Step 8** At the ASA CLI prompt, perform the following steps depending on your connection (console or remote).

- Console connection:
  - a. Copy the entire new configuration to the clipboard, including the altered interface section.
  - b. Clear the running configuration by entering:

```
hostname(config)# clear configure all
```

Traffic through the ASA stops at this point.

- c. Paste in the new configuration at the prompt.

Traffic through the ASA resumes.

- Remote connection:

- a. Save the new configuration to a TFTP or FTP server, so you can copy it to the startup configuration on the ASA. For example, you can run a TFTP or FTP server on your PC.
- b. Clear the startup configuration by entering:

```
hostname(config)# write erase
```

- c. Copy the new configuration to the startup configuration by entering:

```
hostname(config)# copy url startup-config
```

See the [“Downloading a File to a Specific Location” section on page 80-3](#)

- d. Reload the ASA using the **reload** command. Do not save the running configuration.

**Step 9** Reenable failover by entering the **failover** command.

---

### Detailed Steps (Multiple Mode)

We recommend that you update your system and context configurations offline as text files, and reimport them for the following reasons:

- Because you cannot add an allocated interface as a member of a redundant or EtherChannel interface, you must deallocate the interface from any contexts. When you deallocate the interface, any context command that referred to that interface is deleted. Because commands that refer to interfaces are widespread throughout the configuration and affect multiple features, removing an allocation from an in-use interface at the CLI or in ASDM would cause significant damage to your configuration, not to mention significant downtime while you reconfigure all your features around a new interface.
  - Changing your configuration offline lets you use the same interface names for your new logical interfaces, so you do not need to touch the feature configurations that refer to interface names. You only need to change the interface configuration.
  - Clearing the running system configuration and immediately applying a new configuration will minimize the downtime of your interfaces. You will not be waiting to configure the interfaces in real time.
- 

**Step 1** Connect to the ASA, and change to the system; if you are using failover, connect to the active ASA.

**Step 2** If you are using failover, disable failover by entering the **no failover** command.

**Step 3** In the system, copy the running configuration by entering the **more system:running-config** command and copying the display output to a text editor.

Be sure to save an extra copy of the old configuration in case you make an error when you edit it.

For example, you have the following interface configuration and allocation in the system configuration, with shared interfaces between two contexts.

#### System

```
interface GigabitEthernet0/0
```

```

 no shutdown
interface GigabitEthernet0/1
 no shutdown
interface GigabitEthernet0/2
 shutdown
interface GigabitEthernet0/3
 shutdown
interface GigabitEthernet0/4
 shutdown
interface GigabitEthernet0/5
 shutdown
interface Management0/0
 no shutdown
interface Management1/0
 shutdown
!
context customerA
 allocate-interface gigabitethernet0/0 int1
 allocate-interface gigabitethernet0/1 int2
 allocate-interface management0/0 mgmt
context customerB
 allocate-interface gigabitethernet0/0
 allocate-interface gigabitethernet0/1
 allocate-interface management0/0

```

**Step 4** Get copies of *all* context configurations that will use the new EtherChannel or redundant interface. See the [“Backing Up a Context Configuration or Other File in Flash Memory”](#) section on page 80-8.

For example, you download the following context configurations (interface configuration shown):

#### CustomerA Context

```

interface int1
 nameif outside
 security-level 0
 ip address 10.86.194.225 255.255.255.0
!
interface int2
 nameif inside
 security-level 100
 ip address 192.168.1.3 255.255.255.0
 no shutdown
!
interface mgmt
 nameif mgmt
 security-level 100
 ip address 10.1.1.5 255.255.255.0
 management-only

```

#### CustomerB Context

```

interface GigabitEthernet0/0
 nameif outside
 security-level 0
 ip address 10.20.15.5 255.255.255.0
!
interface GigabitEthernet0/1
 nameif inside
 security-level 100
 ip address 192.168.6.78 255.255.255.0
!
interface Management0/0
 nameif mgmt

```

```
security-level 100
ip address 10.8.1.8 255.255.255.0
management-only
```

- Step 5** In the system configuration, create the new logical interfaces according to the [“Configuring a Redundant Interface” section on page 6-24](#) or the [“Configuring an EtherChannel” section on page 6-26](#). Be sure to enter the **no shutdown** command on any additional physical interfaces you want to use as part of the logical interface.

**Note** You can only add *physical* interfaces to an EtherChannel or redundant interface; you cannot have VLANs configured for the physical interfaces.

Be sure to match physical interface parameters such as speed and duplex for all interfaces in a given EtherChannel or redundant interface. Note that the duplex setting for an EtherChannel interface must be Full or Auto.

For example, the new configuration is:

#### System

```
interface GigabitEthernet0/0
 channel-group 1 mode active
 no shutdown
!
interface GigabitEthernet0/1
 channel-group 2 mode active
 no shutdown
!
interface GigabitEthernet0/2
 channel-group 1 mode active
 no shutdown
!
interface GigabitEthernet0/3
 channel-group 1 mode active
 no shutdown
!
interface GigabitEthernet0/4
 channel-group 2 mode active
 no shutdown
!
interface GigabitEthernet0/5
 channel-group 2 mode active
 no shutdown
!
interface Management0/0
 channel-group 3 mode active
 no shutdown
!
interface Management0/1
 channel-group 3 mode active
 no shutdown
!
interface port-channel 1
interface port-channel 2
interface port-channel 3
```

- Step 6** Change the interface allocation per context to use the new EtherChannel or redundant interfaces. See the [“Configuring a Security Context” section on page 5-18](#).

For example, to take advantage of existing cabling, you would continue to use the formerly in-use interfaces in their old roles as part of the inside and outside redundant interfaces:

```
context customerA
 allocate-interface port-channel1 int1
 allocate-interface port-channel2 int2
 allocate-interface port-channel3 mgmt
context customerB
 allocate-interface port-channel1
 allocate-interface port-channel2
 allocate-interface port-channel3
```

#### Note

You might want to take this opportunity to assign mapped names to interfaces if you have not done so already. For example, the configuration for customerA does not need to be altered at all; it just needs to be reapplied on the ASA. The customerB configuration, however, needs to have all of the interface IDs changed; if you assign mapped names for customerB, you still have to change the interface IDs in the context configuration, but mapped names might help future interface changes.

- Step 7** For contexts that do not use mapped names, change the context configuration to use the new EtherChannel or redundant interface ID. (Contexts that use mapped interface names do not require any alteration.)

For example:

#### CustomerB Context

```
interface port-channel1
 nameif outside
 security-level 0
 ip address 10.20.15.5 255.255.255.0
!
interface port-channel2
 nameif inside
 security-level 100
 ip address 192.168.6.78 255.255.255.0
!
interface port-channel3
 nameif mgmt
 security-level 100
 ip address 10.8.1.8 255.255.255.0
 management-only
```

- Step 8** Copy the new context configuration files over the old ones. For example, if your contexts are on an FTP server, copy over the existing files (making backups as desired) using FTP. If your contexts are in flash memory, you can use the **copy** command and run a TFTP or FTP server on your PC, or use secure copy. See the [“Downloading a File to a Specific Location”](#) section on page 80-3. This change only affects the startup configuration; the running configuration is still using the old context configuration.

- Step 9** At the ASA system CLI prompt, perform the following steps depending on your connection (console or remote).

- Console connection:
  - a. Copy the entire new system configuration to the clipboard, including the altered interface section.
  - b. Clear the running configuration (both system and contexts) by entering:

```
hostname(config)# clear configure all
```

Traffic through the ASA stops at this point.

- c. Paste in the new system configuration at the prompt.

All of the new context configurations now reload. When they are finished reloading, traffic through the ASA resumes.

- Remote connection:

- a. Save the new system configuration to a TFTP or FTP server, so you can copy it to the startup configuration on the ASA. For example, you can run a TFTP or FTP server on your PC.
- b. Clear the startup configuration by entering:

```
hostname(config)# write erase
```

- c. Copy the new system configuration to the startup configuration by entering:

```
hostname(config)# copy url startup-config
```

See the [“Downloading a File to a Specific Location” section on page 80-3](#)

- d. Reload the ASA using the **reload** command. Do not save the running configuration.

**Step 10** Reenable failover by entering the **failover** command.

---

## Enabling the Physical Interface and Configuring Ethernet Parameters

This section describes how to:

- Enable the physical interface
- Set a specific speed and duplex (if available)
- Enable pause frames for flow control

### Prerequisites

For multiple context mode, complete this procedure in the system execution space. To change from the context to the system execution space, enter the **changeto system** command.

## Detailed Steps

|        | Command                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>interface</b> <i>physical_interface</i></p> <p><b>Example:</b><br/> <pre>hostname(config)# interface gigabitethernet 0/0</pre></p>           | <p>Specifies the interface you want to configure.</p> <p>where the <i>physical_interface</i> ID includes the type, slot, and port number as <i>type[slot/port]</i>.</p> <p>The physical interface types include the following:</p> <ul style="list-style-type: none"> <li>• <b>ethernet</b></li> <li>• <b>gigabitethernet</b></li> <li>• <b>tengigabitethernet</b></li> <li>• <b>management</b></li> </ul> <p>Enter the type followed by <i>slot/port</i>, for example, <b>gigabitethernet0/1</b> or <b>ethernet 0/1</b>. A space is optional between the type and the slot/port.</p> |
| Step 2 | <p>(Optional)</p> <p><b>media-type sfp</b></p> <p><b>Example:</b><br/> <pre>hostname(config-if)# media-type sfp</pre></p>                          | <p>Sets the media type to SFP, if available for your model. To restore the default RJ-45, enter the <b>media-type rj45</b> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Step 3 | <p>(Optional)</p> <p><b>speed {auto   10   100   1000   nonegotiate}</b></p> <p><b>Example:</b><br/> <pre>hostname(config-if)# speed 100</pre></p> | <p>Sets the speed.</p> <p>For copper interfaces, the default setting is <b>auto</b>.</p> <p>For SFP interfaces, the default setting is <b>no speed nonegotiate</b>, which sets the speed to the maximum speed and enables link negotiation for flow-control parameters and remote fault information. The <b>nonegotiate</b> keyword is the only keyword available for SFP interfaces. The <b>speed nonegotiate</b> command disables link negotiation.</p>                                                                                                                             |
| Step 4 | <p>(Optional)</p> <p><b>duplex {auto   full   half}</b></p> <p><b>Example:</b><br/> <pre>hostname(config-if)# duplex full</pre></p>                | <p>Sets the duplex for copper interfaces. The <b>auto</b> setting is the default.</p> <p><b>Note</b> The duplex setting for an EtherChannel interface must be Full or Auto.</p>                                                                                                                                                                                                                                                                                                                                                                                                       |

|        | Command                                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <p>(Optional)</p> <pre>flowcontrol send on [low_water high_water pause_time] [noconfirm]</pre> <p><b>Example:</b></p> <pre>hostname(config-if)# flowcontrol send on 95 200 10000</pre> | <p>Enables pause (XOFF) frames for flow control on 1-Gigabit and 10-Gigabit Ethernet interfaces.</p> <p>If you have a traffic burst, dropped packets can occur if the burst exceeds the buffering capacity of the FIFO buffer on the NIC and the receive ring buffers. Enabling pause frames for flow control can alleviate this issue. Pause (XOFF) and XON frames are generated automatically by the NIC hardware based on the FIFO buffer usage. A pause frame is sent when the buffer usage exceeds the high-water mark. The default <i>high_water</i> value is 128 KB (10 GigabitEthernet) and 24 KB (1 GigabitEthernet); you can set it between 0 and 511 (10 GigabitEthernet) or 0 and 47 KB (1 GigabitEthernet). After a pause is sent, an XON frame can be sent when the buffer usage is reduced below the low-water mark. By default, the <i>low_water</i> value is 64 KB (10 GigabitEthernet) and 16 KB (1 GigabitEthernet); you can set it between 0 and 511 (10 GigabitEthernet) or 0 and 47 KB (1 GigabitEthernet). The link partner can resume traffic after receiving an XON, or after the XOFF expires, as controlled by the timer value in the pause frame. The default <i>pause_time</i> value is 26624; you can set it between 0 and 65535. If the buffer usage is consistently above the high-water mark, pause frames are sent repeatedly, controlled by the pause refresh threshold value.</p> <p>When you use this command, you see the following warning:</p> <pre>Changing flow-control parameters will reset the interface. Packets may be lost during the reset. Proceed with flow-control changes?</pre> <p>To change the parameters without being prompted, use the <b>noconfirm</b> keyword.</p> <p><b>Note</b> Only flow control frames defined in 802.3x are supported. Priority-based flow control is not supported.</p> |
| Step 6 | <p><b>no shutdown</b></p> <p><b>Example:</b></p> <pre>hostname(config-if)# no shutdown</pre>                                                                                           | <p>Enables the interface. To disable the interface, enter the <b>shutdown</b> command. If you enter the <b>shutdown</b> command, you also shut down all subinterfaces. If you shut down an interface in the system execution space, then that interface is shut down in all contexts that share it.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## What to Do Next

### Optional Tasks:

- Configure redundant interface pairs. See the [“Configuring a Redundant Interface”](#) section on page 6-24.
- Configure an EtherChannel. See the [“Configuring an EtherChannel”](#) section on page 6-26.
- Configure VLAN subinterfaces. See the [“Configuring VLAN Subinterfaces and 802.1Q Trunking”](#) section on page 6-29.

### Required Tasks:

- For multiple context mode, assign interfaces to contexts and automatically assign unique MAC addresses to context interfaces. See the [“Configuring Multiple Contexts”](#) section on page 5-14.

- For single context mode, complete the interface configuration. See [Chapter 8, “Completing Interface Configuration \(Routed Mode\),”](#) or [Chapter 9, “Completing Interface Configuration \(Transparent Mode\).”](#)

## Configuring a Redundant Interface

A logical redundant interface consists of a pair of physical interfaces: an active and a standby interface. When the active interface fails, the standby interface becomes active and starts passing traffic. You can configure a redundant interface to increase the ASA reliability. This feature is separate from device-level failover, but you can configure redundant interfaces as well as failover if desired.

This section describes how to configure redundant interfaces and includes the following topics:

- [Configuring a Redundant Interface, page 6-24](#)
- [Changing the Active Interface, page 6-26](#)

## Configuring a Redundant Interface

This section describes how to create a redundant interface. By default, redundant interfaces are enabled.

### Guidelines and Limitations

- You can configure up to 8 redundant interface pairs.
- Redundant interface delay values are configurable, but by default the ASA inherits the default delay values based on the physical type of its member interfaces.
- See also the [“Redundant Interface Guidelines”](#) section on page 6-9.

### Prerequisites

- Both member interfaces must be of the same physical type. For example, both must be Ethernet.
- You cannot add a physical interface to the redundant interface if you configured a name for it. You must first remove the name using the **no nameif** command.
- For multiple context mode, complete this procedure in the system execution space. To change from the context to the system execution space, enter the **changeto system** command.

#### Caution

If you are using a physical interface already in your configuration, removing the name will clear any configuration that refers to the interface.

## Detailed Steps

|        | Command                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>interface redundant</b> <i>number</i><br><br><b>Example:</b><br>hostname(config)# interface redundant 1                       | Adds the logical redundant interface, where the <i>number</i> argument is an integer between 1 and 8.<br><br><b>Note</b> You need to add at least one member interface to the redundant interface before you can configure logical parameters for it such as a name.                                                                                                                                                    |
| Step 2 | <b>member-interface</b> <i>physical_interface</i><br><br><b>Example:</b><br>hostname(config-if)# member-interface management 0/0 | Adds the first member interface to the redundant interface.<br><br>See the <a href="#">“Enabling the Physical Interface and Configuring Ethernet Parameters”</a> section for a description of the physical interface ID.<br><br>Redundant interfaces do not support Management <i>slot/port</i> interfaces as members.<br><br>After you add the interface, any configuration for it (such as an IP address) is removed. |
| Step 3 | <b>member-interface</b> <i>physical_interface</i><br><br><b>Example:</b><br>hostname(config-if)# member-interface management 1/0 | Adds the second member interface to the redundant interface.<br><br>Make sure the second interface is the same physical type as the first interface.<br><br>To remove a member interface, enter the <b>no member-interface</b> <i>physical_interface</i> command. You cannot remove both member interfaces from the redundant interface; the redundant interface requires at least one member interface.                |

## Examples

The following example creates two redundant interfaces:

```
hostname(config)# interface redundant 1
hostname(config-if)# member-interface gigabitethernet 0/0
hostname(config-if)# member-interface gigabitethernet 0/1
hostname(config-if)# interface redundant 2
hostname(config-if)# member-interface gigabitethernet 0/2
hostname(config-if)# member-interface gigabitethernet 0/3
```

## What to Do Next

Optional Task:

- Configure VLAN subinterfaces. See the [“Configuring VLAN Subinterfaces and 802.1Q Trunking”](#) section on page 6-29.

Required Tasks:

- For multiple context mode, assign interfaces to contexts and automatically assign unique MAC addresses to context interfaces. See the [“Configuring Multiple Contexts”](#) section on page 5-14.
- For single context mode, complete the interface configuration. See the [Chapter 8, “Completing Interface Configuration \(Routed Mode\)”](#), or [Chapter 9, “Completing Interface Configuration \(Transparent Mode\)”](#).

## Changing the Active Interface

By default, the active interface is the first interface listed in the configuration, if it is available. To view which interface is active, enter the following command:

```
hostname# show interface redundantnumber detail | grep Member
```

For example:

```
hostname# show interface redundant1 detail | grep Member
Members GigabitEthernet0/3 (Active), GigabitEthernet0/2
```

To change the active interface, enter the following command:

```
hostname# redundant-interface redundantnumber active-member physical_interface
```

where the **redundantnumber** argument is the redundant interface ID, such as **redundant1**.

The *physical\_interface* is the member interface ID that you want to be active.

## Configuring an EtherChannel

This section describes how to create an EtherChannel port-channel interface, assign interfaces to the EtherChannel, and customize the EtherChannel.

This section includes the following topics:

- [Adding Interfaces to the EtherChannel, page 6-26](#)
- [Customizing the EtherChannel, page 6-28](#)

### Adding Interfaces to the EtherChannel

This section describes how to create an EtherChannel port-channel interface and assign interfaces to the EtherChannel. By default, port-channel interfaces are enabled.

#### Guidelines and Limitations

- You can configure up to 48 EtherChannels.
- Each channel group can have eight active interfaces. Note that you can assign up to 16 interfaces to a channel group. While only eight interfaces can be active, the remaining interfaces can act as standby links in case of interface failure.
- You cannot use interfaces on the 4GE SSM, including the integrated 4GE SSM in slot 1 on the ASA 5550, as part of an EtherChannel.
- See also the [“EtherChannel Guidelines” section on page 6-9](#).

#### Prerequisites

- All interfaces in the channel group must be the same type, speed, and duplex. Half duplex is not supported.
- You cannot add a physical interface to the channel group if you configured a name for it. You must first remove the name using the **no nameif** command.
- For multiple context mode, complete this procedure in the system execution space. To change from the context to the system execution space, enter the **changeto system** command.

**Caution**

If you are using a physical interface already in your configuration, removing the name will clear any configuration that refers to the interface.

**Detailed Steps**

|               | Command                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>interface</b> <i>physical_interface</i><br><br><b>Example:</b><br>hostname(config)# interface<br>gigabitethernet 0/0                                                         | Specifies the interface you want to add to the channel group, where the <i>physical_interface</i> ID includes the type, slot, and port number as <i>type[slot/port]</i> . This first interface in the channel group determines the type and speed for all other interfaces in the group.<br><br>In transparent mode, if you create a channel group with multiple Management interfaces, then you can use this EtherChannel as the management-only interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 2</b> | <b>channel-group</b> <i>channel_id</i> <b>mode</b> { <b>active</b>   <b>passive</b>   <b>on</b> }<br><br><b>Example:</b><br>hostname(config-if)# channel-group 1 mode<br>active | Assigns this physical interface to an EtherChannel with the <i>channel_id</i> between 1 and 48. If the port-channel interface for this channel ID does not yet exist in the configuration, one will be added:<br><br><b>interface port-channel</b> <i>channel_id</i><br><br>We recommend using <b>active</b> mode. For information about active, passive, and on modes, see the <a href="#">“Link Aggregation Control Protocol”</a> section on page 6-6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 3</b> | (Optional)<br><br><b>lacp port-priority</b> <i>number</i><br><br><b>Example:</b><br>hostname(config-if)# lacp port-priority<br>12345                                            | Sets the priority for a physical interface in the channel group between 1 and 65535. The default is 32768. The higher the number, the lower the priority. The ASA uses this setting to decide which interfaces are active and which are standby if you assign more interfaces than can be used. If the port priority setting is the same for all interfaces, then the priority is determined by the interface ID (slot/port). The lowest interface ID is the highest priority. For example, GigabitEthernet 0/0 is a higher priority than GigabitEthernet 0/1.<br><br>If you want to prioritize an interface to be active even though it has a higher interface ID, then set this command to have a lower value. For example, to make GigabitEthernet 1/3 active before GigabitEthernet 0/7, then make the <b>lacp port-priority</b> value be 12345 on the 1/3 interface vs. the default 32768 on the 0/7 interface.<br><br>If the device at the other end of the EtherChannel has conflicting port priorities, the system priority is used to determine which port priorities to use. See the <b>lacp system-priority</b> command in the <a href="#">“Customizing the EtherChannel”</a> section on page 6-28. |
| <b>Step 4</b> | Repeat steps 1 through 5 for each interface you want to add to the channel group.                                                                                               | Each interface in the channel group must be the same type and speed. Half duplex is not supported. If you add an interface that does not match, it will be placed in a suspended state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## What to Do Next

### Optional Tasks:

- Customize the EtherChannel interface. See the [“Customizing the EtherChannel”](#) section on page 6-28.
- Configure VLAN subinterfaces. See the [“Configuring VLAN Subinterfaces and 802.1Q Trunking”](#) section on page 6-29.

### Required Tasks:

- For multiple context mode, assign interfaces to contexts and automatically assign unique MAC addresses to context interfaces. See the [“Configuring Multiple Contexts”](#) section on page 5-14.
- For single context mode, complete the interface configuration. See the [Chapter 8, “Completing Interface Configuration \(Routed Mode\)”](#), or [Chapter 9, “Completing Interface Configuration \(Transparent Mode\)”](#).

## Customizing the EtherChannel

This section describes how to set the maximum number of interfaces in the EtherChannel, the minimum number of operating interfaces for the EtherChannel to be active, the load balancing algorithm, and other optional parameters.

### Detailed Steps

|        | Command                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|-----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>interface port-channel</b> <i>channel_id</i><br><br><b>Example:</b><br>hostname(config)# interface port-channel 1  | Specifies the port-channel interface. This interface was created automatically when you added an interface to the channel group. If you have not yet added an interface, then this command creates the port-channel interface.<br><br><b>Note</b> You need to add at least one member interface to the port-channel interface before you can configure logical parameters for it such as a name. |
| Step 2 | <b>lacp max-bundle</b> <i>number</i><br><br><b>Example:</b><br>hostname(config-if)# lacp max-bundle 6                 | Specifies the maximum number of active interfaces allowed in the channel group, between 1 and 8. The default is 8.                                                                                                                                                                                                                                                                               |
| Step 3 | <b>port-channel min-bundle</b> <i>number</i><br><br><b>Example:</b><br>hostname(config-if)# port-channel min-bundle 2 | Specifies the minimum number of active interfaces required for the port-channel interface to become active, between 1 and 8. The default is 1. If the active interfaces in the channel group falls below this value, then the port-channel interface goes down, and could trigger a device-level failover.                                                                                       |

|        | Command                                                                                                                                                                                                                                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <pre>port-channel load-balance {dst-ip   dst-ip-port   dst-mac   dst-port   src-dst-ip   src-dst-ip-port   src-dst-mac   src-dst-port   src-ip   src-ip-port   src-mac   src-port   vlan-dst-ip   vlan-dst-ip-port   vlan-only   vlan-src-dst-ip   vlan-src-dst-ip-port   vlan-src-ip   vlan-src-ip-port}</pre> <p><b>Example:</b><br/> hostname(config-if)# port-channel<br/> load-balance src-dst-mac</p> | <p>Configures the load-balancing algorithm. By default, the ASA balances the packet load on interfaces according to the source and destination IP address (<b>src-dst-ip</b>) of the packet. If you want to change the properties on which the packet is categorized, use this command. For example, if your traffic is biased heavily towards the same source and destination IP addresses, then the traffic assignment to interfaces in the EtherChannel will be unbalanced. Changing to a different algorithm can result in more evenly distributed traffic. For more information about load balancing, see the <a href="#">“Load Balancing” section on page 6-6</a>.</p> |
| Step 5 | <pre>lACP system-priority number</pre> <p><b>Example:</b><br/> hostname(config)# lACP system-priority<br/> 12345</p>                                                                                                                                                                                                                                                                                        | <p>Sets the LACP system priority, from 1 to 65535. The default is 32768. The higher the number, the lower the priority. This command is global for the ASA.</p> <p>If the device at the other end of the EtherChannel has conflicting port priorities, the system priority is used to determine which port priorities to use. For interface priorities within an EtherChannel, see the <b>lACP port-priority</b> command in the <a href="#">“Adding Interfaces to the EtherChannel” section on page 6-26</a>.</p>                                                                                                                                                            |
| Step 6 | <p>(Optional)</p> <p>You can set the Ethernet properties for the port-channel interface to override the properties set on the individual interfaces.</p>                                                                                                                                                                                                                                                    | <p>This method provides a shortcut to set these parameters because these parameters must match for all interfaces in the channel group. See the <a href="#">“Enabling the Physical Interface and Configuring Ethernet Parameters” section on page 6-21</a> for Ethernet commands.</p>                                                                                                                                                                                                                                                                                                                                                                                        |

## What to Do Next

### Optional Task:

- Configure VLAN subinterfaces. See the [“Configuring VLAN Subinterfaces and 802.1Q Trunking” section on page 6-29](#).

### Required Tasks:

- For multiple context mode, assign interfaces to contexts and automatically assign unique MAC addresses to context interfaces. See the [“Configuring Multiple Contexts” section on page 5-14](#).
- For single context mode, complete the interface configuration. See the [Chapter 8, “Completing Interface Configuration \(Routed Mode\),”](#) or [Chapter 9, “Completing Interface Configuration \(Transparent Mode\).”](#)

## Configuring VLAN Subinterfaces and 802.1Q Trunking

Subinterfaces let you divide a physical, redundant, or EtherChannel interface into multiple logical interfaces that are tagged with different VLAN IDs. An interface with one or more VLAN subinterfaces is automatically configured as an 802.1Q trunk. Because VLANs allow you to keep traffic separate on a given physical interface, you can increase the number of interfaces available to your network without adding additional physical interfaces or ASAs. This feature is particularly useful in multiple context mode so that you can assign unique interfaces to each context.

## Guidelines and Limitations

- Maximum subinterfaces—To determine how many VLAN subinterfaces are allowed for your platform, see the [“Licensing Requirements for ASA 5510 and Higher Interfaces”](#) section on page 6-7.
- Preventing untagged packets on the physical interface—If you use subinterfaces, you typically do not also want the physical interface to pass traffic, because the physical interface passes untagged packets. This property is also true for the active physical interface in a redundant interface pair. Because the physical or redundant interface must be enabled for the subinterface to pass traffic, ensure that the physical or redundant interface does not pass traffic by leaving out the **nameif** command. If you want to let the physical or redundant interface pass untagged packets, you can configure the **nameif** command as usual. See [Chapter 8, “Completing Interface Configuration \(Routed Mode\)”](#), or [Chapter 9, “Completing Interface Configuration \(Transparent Mode\)”](#), for more information about completing the interface configuration.

## Prerequisites

For multiple context mode, complete this procedure in the system execution space. To change from the context to the system execution space, enter the **changeto system** command.

## Detailed Steps

|        | Command                                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>interface</b> { <i>physical_interface</i>   <b>redundant number</b>   <b>port-channel number</b> }. <i>subinterface</i><br><br><b>Example:</b><br>hostname(config)# interface gigabitethernet 0/1.100 | Specifies the new subinterface. See the <a href="#">“Enabling the Physical Interface and Configuring Ethernet Parameters”</a> section for a description of the physical interface ID.<br><br>The <b>redundant number</b> argument is the redundant interface ID, such as <b>redundant 1</b> .<br><br>The <b>port-channel number</b> argument is the EtherChannel interface ID, such as <b>port-channel 1</b> .<br><br>The <i>subinterface</i> ID is an integer between 1 and 4294967293.                                                                                                                                                                |
| Step 2 | <b>vlan</b> <i>vlan_id</i><br><br><b>Example:</b><br>hostname(config-subif)# vlan 101                                                                                                                    | Specifies the VLAN for the subinterface. The <i>vlan_id</i> is an integer between 1 and 4094. Some VLAN IDs might be reserved on connected switches, so check the switch documentation for more information.<br><br>You can only assign a single VLAN to a subinterface, and you cannot assign the same VLAN to multiple subinterfaces. You cannot assign a VLAN to the physical interface. Each subinterface must have a VLAN ID before it can pass traffic. To change a VLAN ID, you do not need to remove the old VLAN ID with the <b>no</b> option; you can enter the <b>vlan</b> command with a different VLAN ID, and the ASA changes the old ID. |

## What to Do Next

(Optional) For the ASA 5580 and 5585-X, enable jumbo frame support according to the [“Enabling Jumbo Frame Support \(Supported Models\)”](#) section on page 6-31.

## Enabling Jumbo Frame Support (Supported Models)

A jumbo frame is an Ethernet packet larger than the standard maximum of 1518 bytes (including Layer 2 header and FCS), up to 9216 bytes. You can enable support for jumbo frames for all interfaces by increasing the amount of memory to process Ethernet frames. Assigning more memory for jumbo frames might limit the maximum use of other features, such as access lists.

Supported models include:

- ASA 5580
- ASA 5585-X

### Prerequisites

- In multiple context mode, set this option in the system execution space.
- Changes in this setting require you to reload the ASA.
- Be sure to set the MTU for each interface that needs to transmit jumbo frames to a higher value than the default 1500; for example, set the value to 9000 using the **mtu** command. See the [“Configuring the MAC Address and MTU” section on page 8-8](#). In multiple context mode, set the MTU within each context.

### Detailed Steps

| Command                                                      | Purpose                                                                                                                   |
|--------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>jumbo-frame reservation</b>                               | Enables jumbo frame support for the ASA 5580 and 5585-X. To disable jumbo frames, use the <b>no</b> form of this command. |
| <b>Example:</b><br>hostname(config)# jumbo-frame reservation |                                                                                                                           |

### Examples

The following example enables jumbo frame reservation, saves the configuration, and reloads the ASA:

```
hostname(config)# jumbo-frame reservation
WARNING: this command will take effect after the running-config is saved
and the system has been rebooted. Command accepted.

hostname(config)# write memory
Building configuration...
Cryptochecksum: 718e3706 4edb11ea 69af58d0 0a6b7cb5

70291 bytes copied in 3.710 secs (23430 bytes/sec)
[OK]
hostname(config)# reload
Proceed with reload? [confirm] y
```

# Monitoring Interfaces

To monitor interfaces, enter one of the following commands:

| Command                                                                                                                                         | Purpose                                                                                                                                                        |
|-------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>show interface</code>                                                                                                                     | Displays interface statistics.                                                                                                                                 |
| <code>show interface ip brief</code>                                                                                                            | Displays interface IP addresses and status.                                                                                                                    |
| <code>show lacp</code> <i>{[channel_group_number] {counters   internal   neighbor}   sys-id}</i>                                                | For EtherChannel, displays LACP information such as traffic statistics, system identifier and neighbor details.                                                |
| <code>show port-channel</code> <i>[channel_group_number] [brief   detail   port   protocol   summary]</i>                                       | For EtherChannel, displays EtherChannel information in a detailed and one-line summary form. This command also displays the port and port-channel information. |
| <code>show port-channel</code> <i>channel_group_number load-balance [hash-result {ip   ipv6   l4port   mac   mixed   vlan-only} parameters]</i> | For EtherChannel, displays port-channel load-balance information along with the hash result and member interface selected for a given set of parameters.       |

# Configuration Examples for ASA 5510 and Higher Interfaces

This section includes the following topics:

- [Physical Interface Parameters Example, page 6-32](#)
- [Subinterface Parameters Example, page 6-32](#)
- [Multiple Context Mode Example, page 6-33](#)
- [EtherChannel Example, page 6-33](#)

## Physical Interface Parameters Example

The following example configures parameters for the physical interface in single mode:

```
interface gigabitethernet 0/1
 speed 1000
 duplex full
 no shutdown
```

## Subinterface Parameters Example

The following example configures parameters for a subinterface in single mode:

```
interface gigabitethernet 0/1.1
 vlan 101
 no shutdown
```

## Multiple Context Mode Example

The following example configures interface parameters in multiple context mode for the system configuration, and allocates the gigabitethernet 0/1.1 subinterface to contextA:

```
interface gigabitethernet 0/1
 speed 1000
 duplex full
 no shutdown
interface gigabitethernet 0/1.1
 vlan 101
context contextA
 allocate-interface gigabitethernet 0/1.1
```

## EtherChannel Example

The following example configures three interfaces as part of an EtherChannel. It also sets the system priority to be a higher priority, and GigabitEthernet 0/2 to be a higher priority than the other interfaces in case more than eight interfaces are assigned to the EtherChannel.

```
lacp system-priority 1234
interface GigabitEthernet0/0
 channel-group 1 mode active
interface GigabitEthernet0/1
 channel-group 1 mode active
interface GigabitEthernet0/2
 lacp port-priority 1234
 channel-group 1 mode passive
interface Port-channel1
 lacp max-bundle 4
 port-channel min-bundle 2
 port-channel load-balance dst-ip
```

## Where to Go Next

- For multiple context mode:
  - a. Assign interfaces to contexts and automatically assign unique MAC addresses to context interfaces. See [Chapter 5, “Configuring Multiple Context Mode.”](#)
  - b. Complete the interface configuration according to [Chapter 8, “Completing Interface Configuration \(Routed Mode\),”](#) or [Chapter 9, “Completing Interface Configuration \(Transparent Mode\).”](#)
- For single context mode, complete the interface configuration according to [Chapter 8, “Completing Interface Configuration \(Routed Mode\),”](#) or [Chapter 9, “Completing Interface Configuration \(Transparent Mode\).”](#)

# Feature History for ASA 5510 and Higher Interfaces

Table 6-3 lists the release history for this feature.

**Table 6-3** Feature History for Interfaces

| Feature Name                                                    | Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Increased VLANs                                                 | 7.0(5)   | Increased the following limits: <ul style="list-style-type: none"> <li>ASA5510 Base license VLANs from 0 to 10.</li> <li>ASA5510 Security Plus license VLANs from 10 to 25.</li> <li>ASA5520 VLANs from 25 to 100.</li> <li>ASA5540 VLANs from 100 to 200.</li> </ul>                                                                                                                                                                                                                                                                                          |
| Increased interfaces for the Base license on the ASA 5510       | 7.2(2)   | For the Base license on the ASA 5510, the maximum number of interfaces was increased from 3 plus a management interface to unlimited interfaces.                                                                                                                                                                                                                                                                                                                                                                                                               |
| Increased VLANs                                                 | 7.2(2)   | VLAN limits were increased for the ASA 5510 (from 10 to 50 for the Base license, and from 25 to 100 for the Security Plus license), the ASA 5520 (from 100 to 150), the ASA 5550 (from 200 to 250).                                                                                                                                                                                                                                                                                                                                                            |
| Gigabit Ethernet Support for the ASA 5510 Security Plus License | 7.2(3)   | The ASA 5510 ASA now supports GE (Gigabit Ethernet) for port 0 and 1 with the Security Plus license. If you upgrade the license from Base to Security Plus, the capacity of the external Ethernet0/0 and Ethernet0/1 ports increases from the original FE (Fast Ethernet) (100 Mbps) to GE (1000 Mbps). The interface names will remain Ethernet 0/0 and Ethernet 0/1. Use the <b>speed</b> command to change the speed on the interface and use the <b>show interface</b> command to see what speed is currently configured for each interface.               |
| Jumbo packet support for the ASA 5580                           | 8.1(1)   | The Cisco ASA 5580 supports jumbo frames. A jumbo frame is an Ethernet packet larger than the standard maximum of 1518 bytes (including Layer 2 header and FCS), up to 9216 bytes. You can enable support for jumbo frames for all interfaces by increasing the amount of memory to process Ethernet frames. Assigning more memory for jumbo frames might limit the maximum use of other features, such as access lists.<br><br>This feature is also supported on the ASA 5585-X.<br><br>We introduced the following command: <b>jumbo-frame reservation</b> . |
| Increased VLANs for the ASA 5580                                | 8.1(2)   | The number of VLANs supported on the ASA 5580 are increased from 100 to 250.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 6-3**      *Feature History for Interfaces (continued)*

| Feature Name                                                                             | Releases      | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------------------------------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Support for Pause Frames for Flow Control on the ASA 5580 10-Gigabit Ethernet Interfaces | 8.2(2)        | You can now enable pause (XOFF) frames for flow control. This feature is also supported on the ASA 5585-X. We introduced the following command: <b>flowcontrol</b> .                                                                                                                                                                                                                                                                                                                   |
| Support for Pause Frames for Flow Control on 1-Gigabit Ethernet Interfaces               | 8.2(5)/8.4(2) | You can now enable pause (XOFF) frames for flow control for 1-Gigabit interfaces on all models. We modified the following command: <b>flowcontrol</b> .                                                                                                                                                                                                                                                                                                                                |
| EtherChannel support                                                                     | 8.4(1)        | <p>You can configure up to 48 802.3ad EtherChannels of eight active interfaces each.</p> <p>We introduced the following commands: <b>channel-group</b>, <b>lacp port-priority</b>, <b>interface port-channel</b>, <b>lacp max-bundle</b>, <b>port-channel min-bundle</b>, <b>port-channel load-balance</b>, <b>lacp system-priority</b>, <b>clear lacp counters</b>, <b>show lacp</b>, <b>show port-channel</b>.</p> <p><b>Note</b> EtherChannel is not supported on the ASA 5505.</p> |

# CHAPTER 7

## Starting Interface Configuration (ASA 5505)

---

This chapter includes tasks for starting your interface configuration for the ASA 5505, including creating VLAN interfaces and assigning them to switch ports.

For ASA 5510 and higher configuration, see the [“Feature History for ASA 5505 Interfaces”](#) section on page 7-13.

This chapter includes the following sections:

- [Information About ASA 5505 Interfaces, page 7-1](#)
- [Licensing Requirements for ASA 5505 Interfaces, page 7-4](#)
- [Guidelines and Limitations, page 7-5](#)
- [Default Settings, page 7-5](#)
- [Starting ASA 5505 Interface Configuration, page 7-6](#)
- [Monitoring Interfaces, page 7-11](#)
- [Configuration Examples for ASA 5505 Interfaces, page 7-11](#)
- [Where to Go Next, page 7-13](#)
- [Feature History for ASA 5505 Interfaces, page 7-13](#)

## Information About ASA 5505 Interfaces

This section describes the ports and interfaces of the ASA 5505 and includes the following topics:

- [Understanding ASA 5505 Ports and Interfaces, page 7-2](#)
- [Maximum Active VLAN Interfaces for Your License, page 7-2](#)
- [VLAN MAC Addresses, page 7-4](#)
- [Power over Ethernet, page 7-4](#)
- [Monitoring Traffic Using SPAN, page 7-4](#)
- [Auto-MDI/MDIX Feature, page 7-4](#)

## Understanding ASA 5505 Ports and Interfaces

The ASA 5505 supports a built-in switch. There are two kinds of ports and interfaces that you need to configure:

- Physical switch ports—The ASA has 8 Fast Ethernet switch ports that forward traffic at Layer 2, using the switching function in hardware. Two of these ports are PoE ports. See the “[Power over Ethernet](#)” section on page 7-4 for more information. You can connect these interfaces directly to user equipment such as PCs, IP phones, or a DSL modem. Or you can connect to another switch.
- Logical VLAN interfaces—In routed mode, these interfaces forward traffic between VLAN networks at Layer 3, using the configured security policy to apply firewall and VPN services. In transparent mode, these interfaces forward traffic between the VLANs on the same network at Layer 2, using the configured security policy to apply firewall services. See the “[Maximum Active VLAN Interfaces for Your License](#)” section for more information about the maximum VLAN interfaces. VLAN interfaces let you divide your equipment into separate VLANs, for example, home, business, and Internet VLANs.

To segregate the switch ports into separate VLANs, you assign each switch port to a VLAN interface. Switch ports on the same VLAN can communicate with each other using hardware switching. But when a switch port on VLAN 1 wants to communicate with a switch port on VLAN 2, then the ASA applies the security policy to the traffic and routes or bridges between the two VLANs.

## Maximum Active VLAN Interfaces for Your License

In routed mode, you can configure the following VLANs depending on your license:

- Base license—3 active VLANs. The third VLAN can only be configured to initiate traffic to one other VLAN. See [Figure 7-1](#) for more information.
- Security Plus license—20 active VLANs.

In transparent firewall mode, you can configure the following VLANs depending on your license:

- Base license—2 active VLANs in 1 bridge group.
- Security Plus license—3 active VLANs: 2 active VLANs in 1 bridge group, and 1 active VLAN for the failover link.

**Note**

---

An *active VLAN* is a VLAN with a **nameif** command configured.

---

With the Base license in routed mode, the third VLAN can only be configured to initiate traffic to one other VLAN. See [Figure 7-1](#) for an example network where the Home VLAN can communicate with the Internet, but cannot initiate contact with Business.

**Figure 7-1** ASA 5505 with Base License

With the Security Plus license, you can configure 20 VLAN interfaces in routed mode, including a VLAN interface for failover and a VLAN interface as a backup link to your ISP. You can configure the backup interface to not pass through traffic unless the route through the primary interface fails. You can configure trunk ports to accommodate multiple VLANs per port.

**Note**

The ASA 5505 supports Active/Standby failover, but not Stateful Failover.

See [Figure 7-2](#) for an example network.

**Figure 7-2** ASA 5505 with Security Plus License

## VLAN MAC Addresses

- Routed firewall mode—All VLAN interfaces share a MAC address. Ensure that any connected switches can support this scenario. If the connected switches require unique MAC addresses, you can manually assign MAC addresses. See the [“Configuring the MAC Address and MTU” section on page 8-8](#).
- Transparent firewall mode—Each VLAN has a unique MAC address. You can override the generated MAC addresses if desired by manually assigning MAC addresses. See the [“Configuring the MAC Address and MTU” section on page 9-11](#).

## Power over Ethernet

Ethernet 0/6 and Ethernet 0/7 support PoE for devices such as IP phones or wireless access points. If you install a non-PoE device or do not connect to these switch ports, the ASA does not supply power to the switch ports.

If you shut down the switch port using the **shutdown** command, you disable power to the device. Power is restored when you enable the port using the **no shutdown** command. See the [“Configuring and Enabling Switch Ports as Access Ports” section on page 7-7](#) for more information about shutting down a switch port.

To view the status of PoE switch ports, including the type of device connected (Cisco or IEEE 802.3af), use the **show power inline** command.

## Monitoring Traffic Using SPAN

If you want to monitor traffic that enters or exits one or more switch ports, you can enable SPAN, also known as switch port monitoring. The port for which you enable SPAN (called the destination port) receives a copy of every packet transmitted or received on a specified source port. The SPAN feature lets you attach a sniffer to the destination port so you can monitor all traffic; without SPAN, you would have to attach a sniffer to every port you want to monitor. You can only enable SPAN for one destination port.

See the **switchport monitor** command in the *Cisco ASA 5500 Series Command Reference* for more information.

## Auto-MDI/MDIX Feature

All ASA 5505 interfaces include the Auto-MDI/MDIX feature. Auto-MDI/MDIX eliminates the need for crossover cabling by performing an internal crossover when a straight cable is detected during the auto-negotiation phase. You cannot disable Auto-MDI/MDIX.

## Licensing Requirements for ASA 5505 Interfaces

| Model    | License Requirement                                                                                                                                                                                                                                                                                                                               |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ASA 5505 | <p>VLANs:</p> <p>Base License: 3 (2 regular zones and 1 restricted zone that can only communicate with 1 other zone)</p> <p>Security Plus License: 20</p> <p>VLAN Trunks:</p> <p>Base License: None.</p> <p>Security Plus License: 8.</p> <p>Interfaces of all types<sup>1</sup>:</p> <p>Base License: 52.</p> <p>Security Plus License: 120.</p> |

1. The maximum number of combined interfaces; for example, VLANs, physical, redundant, and bridge group interfaces.

## Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

### Context Mode Guidelines

The ASA 5505 does not support multiple context mode.

### Firewall Mode Guidelines

- In transparent mode, you can configure up to eight bridge groups. Note that you must use at least one bridge group; data interfaces must belong to a bridge group.
- Each bridge group can include up to four VLAN interfaces, up to the license limit.

## Default Settings

This section lists default settings for interfaces if you do not have a factory default configuration. For information about the factory default configurations, see the [“Factory Default Configurations” section on page 2-10](#).

### Default State of Interfaces

Interfaces have the following default states:

- Switch ports—Disabled.
- VLANs—Enabled. However, for traffic to pass through the VLAN, the switch port must also be enabled.

### Default Speed and Duplex

By default, the speed and duplex are set to auto-negotiate.

# Starting ASA 5505 Interface Configuration

This section includes the following topics:

- [Task Flow for Starting Interface Configuration, page 7-6](#)
- [Configuring VLAN Interfaces, page 7-6](#)
- [Configuring and Enabling Switch Ports as Access Ports, page 7-7](#)
- [Configuring and Enabling Switch Ports as Trunk Ports, page 7-9](#)

## Task Flow for Starting Interface Configuration

To configure interfaces in single mode, perform the following steps:

- 
- |               |                                                                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | Configure VLAN interfaces. See the <a href="#">“Configuring VLAN Interfaces” section on page 7-6</a> .                                                                                                                  |
| <b>Step 2</b> | Configure and enable switch ports as access ports. See the <a href="#">“Configuring and Enabling Switch Ports as Access Ports” section on page 7-7</a> .                                                                |
| <b>Step 3</b> | (Optional for Security Plus licenses) Configure and enable switch ports as trunk ports. See the <a href="#">“Configuring and Enabling Switch Ports as Trunk Ports” section on page 7-9</a> .                            |
| <b>Step 4</b> | Complete the interface configuration according to <a href="#">Chapter 8, “Completing Interface Configuration (Routed Mode),”</a> or <a href="#">Chapter 9, “Completing Interface Configuration (Transparent Mode).”</a> |
- 

## Configuring VLAN Interfaces

This section describes how to configure VLAN interfaces. For more information about ASA 5505 interfaces, see the [“Information About ASA 5505 Interfaces” section on page 7-1](#).

### Guidelines

We suggest that you finalize your interface configuration before you enable Easy VPN.

## Detailed Steps

|        | Command                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>interface vlan</b> <i>number</i><br><br><b>Example:</b><br>hostname(config)# interface vlan 100                                                                    | Adds a VLAN interface, where the <i>number</i> is between 1 and 4090.<br><br>To remove this VLAN interface and all associated configuration, enter the <b>no interface vlan</b> command. Because this interface also includes the interface name configuration, and the name is used in other commands, those commands are also removed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Step 2 | (Optional for the Base license)<br><br><b>no forward interface vlan</b> <i>number</i><br><br><b>Example:</b><br>hostname(config-if)# no forward interface<br>vlan 101 | Allows this interface to be the third VLAN by limiting it from initiating contact to one other VLAN.<br><br>The <i>number</i> specifies the VLAN ID to which this VLAN interface cannot initiate traffic.<br><br>With the Base license, you can only configure a third VLAN if you use this command to limit it.<br><br>For example, you have one VLAN assigned to the outside for Internet access, one VLAN assigned to an inside business network, and a third VLAN assigned to your home network. The home network does not need to access the business network, so you can use the <b>no forward interface</b> command on the home VLAN; the business network can access the home network, but the home network cannot access the business network.<br><br>If you already have two VLAN interfaces configured with a <b>nameif</b> command, be sure to enter the <b>no forward interface</b> command before the <b>nameif</b> command on the third interface; the ASA does not allow three fully functioning VLAN interfaces with the Base license on the ASA 5505.<br><br><b>Note</b> If you upgrade to the Security Plus license, you can remove this command and achieve full functionality for this interface. If you leave this command in place, this interface continues to be limited even after upgrading. |

## What to Do Next

Configure the switch ports. See the [“Configuring and Enabling Switch Ports as Access Ports”](#) section on page 7-7 and the [“Configuring and Enabling Switch Ports as Trunk Ports”](#) section on page 7-9.

## Configuring and Enabling Switch Ports as Access Ports

By default (with no configuration), all switch ports are shut down, and assigned to VLAN 1. To assign a switch port to a single VLAN, configure it as an access port. To create a trunk port to carry multiple VLANs, see the [“Configuring and Enabling Switch Ports as Trunk Ports”](#) section on page 7-9. If you have a factory default configuration, see the [“ASA 5505 Default Configuration”](#) section on page 2-11 to check if you want to change the default interface settings according to this procedure.

For more information about ASA 5505 interfaces, see the [“Information About ASA 5505 Interfaces”](#) section on page 7-1.

**Caution**

The ASA 5505 does not support Spanning Tree Protocol for loop detection in the network. Therefore you must ensure that any connection with the ASA does not end up in a network loop.

**Detailed Steps**

|               | Command                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <code>interface ethernet0/</code> <i>port</i><br><br><b>Example:</b><br><code>hostname(config)# interface ethernet0/1</code>                 | Specifies the switch port you want to configure, where <i>port</i> is 0 through 7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 2</b> | <code>switchport access vlan</code> <i>number</i><br><br><b>Example:</b><br><code>hostname(config-if)# switchport access<br/>vlan 100</code> | Assigns this switch port to a VLAN, where <i>number</i> is the VLAN ID, between 1 and 4090. See the <a href="#">“Configuring VLAN Interfaces” section on page 7-6</a> to configure the VLAN interface that you want to assign to this switch port. To view configured VLANs, enter the <b>show interface</b> command.<br><br><b>Note</b> You might assign multiple switch ports to the primary or backup VLANs if the Internet access device includes Layer 2 redundancy.                                                                                                                                                                                                                                                                                     |
| <b>Step 3</b> | (Optional)<br><code>switchport protected</code><br><br><b>Example:</b><br><code>hostname(config-if)# switchport protected</code>             | Prevents the switch port from communicating with other protected switch ports on the same VLAN.<br><br>You might want to prevent switch ports from communicating with each other if the devices on those switch ports are primarily accessed from other VLANs, you do not need to allow intra-VLAN access, and you want to isolate the devices from each other in case of infection or other security breach. For example, if you have a DMZ that hosts three web servers, you can isolate the web servers from each other if you apply the <b>switchport protected</b> command to each switch port. The inside and outside networks can both communicate with all three web servers, and vice versa, but the web servers cannot communicate with each other. |
| <b>Step 4</b> | (Optional)<br><code>speed {auto   10   100}</code><br><br><b>Example:</b><br><code>hostname(config-if)# speed 100</code>                     | Sets the speed. The <b>auto</b> setting is the default. If you set the speed to anything other than <b>auto</b> on PoE ports Ethernet 0/6 or 0/7, then Cisco IP phones and Cisco wireless access points that do not support IEEE 802.3af will not be detected and supplied with power.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 5</b> | (Optional)<br><code>duplex {auto   full   half}</code><br><br><b>Example:</b><br><code>hostname(config-if)# duplex full</code>               | Sets the duplex. The <b>auto</b> setting is the default. If you set the duplex to anything other than <b>auto</b> on PoE ports Ethernet 0/6 or 0/7, then Cisco IP phones and Cisco wireless access points that do not support IEEE 802.3af will not be detected and supplied with power.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

To disable the switch port, enter the <b>shutdown</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## What to Do Next

- If you want to configure a switch port as a trunk port, see the [“Configuring and Enabling Switch Ports as Trunk Ports”](#) section on page 7-9.
- To complete the interface configuration, see [Chapter 8, “Completing Interface Configuration \(Routed Mode\)”](#) or [Chapter 9, “Completing Interface Configuration \(Transparent Mode\)”](#).

## Configuring and Enabling Switch Ports as Trunk Ports

This procedure describes how to create a trunk port that can carry multiple VLANs using 802.1Q tagging. Trunk mode is available only with the Security Plus license.

To create an access port, where an interface is assigned to only one VLAN, see the [“Configuring and Enabling Switch Ports as Access Ports”](#) section on page 7-7.

## Guidelines

This switch port cannot pass traffic until you assign at least one VLAN to it, native or non-native.

## Detailed Steps

|        | Command                                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>interface ethernet0/port</b><br><br><b>Example:</b><br>hostname(config)# interface ethernet0/1                                                                                                           | Specifies the switch port you want to configure, where <i>port</i> is 0 through 7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 2 | To assign VLANs to this trunk, do one or more of the following:<br><br><b>switchport trunk allowed vlan vlan_range</b><br><br><b>Example:</b><br>hostname(config)# switchport trunk allowed<br>vlan 100-200 | Identifies one or more VLANs that you can assign to the trunk port, where the <i>vlan_range</i> (with VLANs between 1 and 4090) can be identified in one of the following ways: <ul style="list-style-type: none"><li>• A single number (n)</li><li>• A range (n-x)</li><li>• Separate numbers and ranges by commas, for example:<br/>5,7-10,13,45-100</li></ul> You can enter spaces instead of commas, but the command is saved to the configuration with commas.<br><br>You can include the native VLAN in this command, but it is not required; the native VLAN is passed whether it is included in this command or not. |

|        | Command                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|        | <b>switchport trunk native vlan <i>vlan_id</i></b><br><br><b>Example:</b><br>hostname(config-if)# switchport trunk native vlan 100 | Assigns a native VLAN to the trunk, where the <i>vlan_id</i> is a single VLAN ID between 1 and 4090.<br><br>Packets on the native VLAN are not modified when sent over the trunk. For example, if a port has VLANs 2, 3 and 4 assigned to it, and VLAN 2 is the native VLAN, then packets on VLAN 2 that egress the port are not modified with an 802.1Q header. Frames which ingress (enter) this port and have no 802.1Q header are put into VLAN 2.<br><br>Each port can only have one native VLAN, but every port can have either the same or a different native VLAN.                                                                                                                                                                                    |
| Step 3 | <b>switchport mode trunk</b><br><br><b>Example:</b><br>hostname(config-if)# switchport mode trunk                                  | Makes this switch port a trunk port. To restore this port to access mode, enter the <b>switchport mode access</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Step 4 | (Optional)<br><br><b>switchport protected</b><br><br><b>Example:</b><br>hostname(config-if)# switchport protected                  | Prevents the switch port from communicating with other protected switch ports on the same VLAN.<br><br>You might want to prevent switch ports from communicating with each other if the devices on those switch ports are primarily accessed from other VLANs, you do not need to allow intra-VLAN access, and you want to isolate the devices from each other in case of infection or other security breach. For example, if you have a DMZ that hosts three web servers, you can isolate the web servers from each other if you apply the <b>switchport protected</b> command to each switch port. The inside and outside networks can both communicate with all three web servers, and vice versa, but the web servers cannot communicate with each other. |
| Step 5 | (Optional)<br><br><b>speed {auto   10   100}</b><br><br><b>Example:</b><br>hostname(config-if)# speed 100                          | Sets the speed. The <b>auto</b> setting is the default. If you set the speed to anything other than <b>auto</b> on PoE ports Ethernet 0/6 or 0/7, then Cisco IP phones and Cisco wireless access points that do not support IEEE 802.3af will not be detected and supplied with power.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 6 | (Optional)<br><br><b>duplex {auto   full   half}</b><br><br><b>Example:</b><br>hostname(config-if)# duplex full                    | Sets the duplex. The <b>auto</b> setting is the default. If you set the duplex to anything other than <b>auto</b> on PoE ports Ethernet 0/6 or 0/7, then Cisco IP phones and Cisco wireless access points that do not support IEEE 802.3af will not be detected and supplied with power.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Step 7 | <b>no shutdown</b><br><br><b>Example:</b><br>hostname(config-if)# no shutdown                                                      | Enables the switch port. To disable the switch port, enter the <b>shutdown</b> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

# Monitoring Interfaces

To monitor interfaces, enter one of the following commands:

| Command                              | Purpose                                     |
|--------------------------------------|---------------------------------------------|
| <code>show interface</code>          | Displays interface statistics.              |
| <code>show interface ip brief</code> | Displays interface IP addresses and status. |

## Configuration Examples for ASA 5505 Interfaces

This section includes the following topics:

- [Access Port Example, page 7-11](#)
- [Trunk Port Example, page 7-12](#)

### Access Port Example

The following example configures five VLAN interfaces, including the failover interface which is configured using the **failover lan** command:

```
hostname(config)# interface vlan 100
hostname(config-if)# nameif outside
hostname(config-if)# security-level 0
hostname(config-if)# ip address 10.1.1.1 255.255.255.0
hostname(config-if)# no shutdown

hostname(config-if)# interface vlan 200
hostname(config-if)# nameif inside
hostname(config-if)# security-level 100
hostname(config-if)# ip address 10.2.1.1 255.255.255.0
hostname(config-if)# no shutdown

hostname(config-if)# interface vlan 300
hostname(config-if)# nameif dmz
hostname(config-if)# security-level 50
hostname(config-if)# ip address 10.3.1.1 255.255.255.0
hostname(config-if)# no shutdown

hostname(config-if)# interface vlan 400
hostname(config-if)# nameif backup-isp
hostname(config-if)# security-level 50
hostname(config-if)# ip address 10.1.2.1 255.255.255.0
hostname(config-if)# no shutdown

hostname(config-if)# failover lan faillink vlan500
hostname(config)# failover interface ip faillink 10.4.1.1 255.255.255.0 standby 10.4.1.2
255.255.255.0

hostname(config)# interface ethernet 0/0
hostname(config-if)# switchport access vlan 100
hostname(config-if)# no shutdown

hostname(config-if)# interface ethernet 0/1
hostname(config-if)# switchport access vlan 200
```

```

hostname(config-if)# no shutdown

hostname(config-if)# interface ethernet 0/2
hostname(config-if)# switchport access vlan 300
hostname(config-if)# no shutdown

hostname(config-if)# interface ethernet 0/3
hostname(config-if)# switchport access vlan 400
hostname(config-if)# no shutdown

hostname(config-if)# interface ethernet 0/4
hostname(config-if)# switchport access vlan 500
hostname(config-if)# no shutdown

```

## Trunk Port Example

The following example configures seven VLAN interfaces, including the failover interface which is configured using the **failover lan** command. VLANs 200, 201, and 202 are trunked on Ethernet 0/1.

```

hostname(config)# interface vlan 100
hostname(config-if)# nameif outside
hostname(config-if)# security-level 0
hostname(config-if)# ip address 10.1.1.1 255.255.255.0
hostname(config-if)# no shutdown

hostname(config-if)# interface vlan 200
hostname(config-if)# nameif inside
hostname(config-if)# security-level 100
hostname(config-if)# ip address 10.2.1.1 255.255.255.0
hostname(config-if)# no shutdown

hostname(config-if)# interface vlan 201
hostname(config-if)# nameif dept1
hostname(config-if)# security-level 90
hostname(config-if)# ip address 10.2.2.1 255.255.255.0
hostname(config-if)# no shutdown

hostname(config-if)# interface vlan 202
hostname(config-if)# nameif dept2
hostname(config-if)# security-level 90
hostname(config-if)# ip address 10.2.3.1 255.255.255.0
hostname(config-if)# no shutdown

hostname(config-if)# interface vlan 300
hostname(config-if)# nameif dmz
hostname(config-if)# security-level 50
hostname(config-if)# ip address 10.3.1.1 255.255.255.0
hostname(config-if)# no shutdown

hostname(config-if)# interface vlan 400
hostname(config-if)# nameif backup-isp
hostname(config-if)# security-level 50
hostname(config-if)# ip address 10.1.2.1 255.255.255.0
hostname(config-if)# no shutdown

hostname(config-if)# failover lan faillink vlan500
hostname(config)# failover interface ip faillink 10.4.1.1 255.255.255.0 standby 10.4.1.2
255.255.255.0

hostname(config)# interface ethernet 0/0
hostname(config-if)# switchport access vlan 100

```

```

hostname(config-if)# no shutdown

hostname(config-if)# interface ethernet 0/1
hostname(config-if)# switchport mode trunk
hostname(config-if)# switchport trunk allowed vlan 200-202
hostname(config-if)# switchport trunk native vlan 5
hostname(config-if)# no shutdown

hostname(config-if)# interface ethernet 0/2
hostname(config-if)# switchport access vlan 300
hostname(config-if)# no shutdown

hostname(config-if)# interface ethernet 0/3
hostname(config-if)# switchport access vlan 400
hostname(config-if)# no shutdown

hostname(config-if)# interface ethernet 0/4
hostname(config-if)# switchport access vlan 500
hostname(config-if)# no shutdown

```

## Where to Go Next

Complete the interface configuration according to [Chapter 8, “Completing Interface Configuration \(Routed Mode\),”](#) or [Chapter 9, “Completing Interface Configuration \(Transparent Mode\).”](#)

## Feature History for ASA 5505 Interfaces

[Table 7-1](#) lists the release history for this feature.

**Table 7-1** Feature History for Interfaces

| Feature Name                         | Releases      | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Increased VLANs                      | 7.2(2)        | The maximum number of VLANs for the Security Plus license on the ASA 5505 was increased from 5 (3 fully functional; 1 failover; one restricted to a backup interface) to 20 fully functional interfaces. In addition, the number of trunk ports was increased from 1 to 8. Now there are 20 fully functional interfaces, you do not need to use the backup interface command to cripple a backup ISP interface; you can use a fully-functional interface for it. The backup interface command is still useful for an Easy VPN configuration. |
| Native VLAN support for the ASA 5505 | 7.2(4)/8.0(4) | You can now include the native VLAN in an ASA 5505 trunk port.<br><br>We introduced the following command: <b>switchport trunk native vlan</b> .                                                                                                                                                                                                                                                                                                                                                                                             |

## CHAPTER 8

# Completing Interface Configuration (Routed Mode)

---

This chapter includes tasks to complete the interface configuration for all models in routed firewall mode. This chapter includes the following sections:

- [Information About Completing Interface Configuration in Routed Mode, page 8-1](#)
- [Licensing Requirements for Completing Interface Configuration in Routed Mode, page 8-2](#)
- [Guidelines and Limitations, page 8-4](#)
- [Default Settings, page 8-5](#)
- [Completing Interface Configuration in Routed Mode, page 8-5](#)
- [Monitoring Interfaces, page 8-15](#)
- [Configuration Examples for Interfaces in Routed Mode, page 8-15](#)
- [Feature History for Interfaces in Routed Mode, page 8-16](#)

### Note

For multiple context mode, complete the tasks in this section in the context execution space. Enter the **changeto context *name*** command to change to the context you want to configure.

---

## Information About Completing Interface Configuration in Routed Mode

This section includes the following topics:

- [Security Levels, page 8-1](#)
- [Dual IP Stack \(IPv4 and IPv6\), page 8-2](#)

### Security Levels

Each interface must have a security level from 0 (lowest) to 100 (highest). For example, you should assign your most secure network, such as the inside host network, to level 100. While the outside network connected to the Internet can be level 0. Other networks, such as DMZs can be in between. You can assign interfaces to the same security level. See the [“Allowing Same Security Level Communication” section on page 8-14](#) for more information.

The level controls the following behavior:

- Network access—By default, there is an implicit permit from a higher security interface to a lower security interface (outbound). Hosts on the higher security interface can access any host on a lower security interface. You can limit access by applying an access list to the interface.

If you enable communication for same security interfaces (see the [“Allowing Same Security Level Communication” section on page 8-14](#)), there is an implicit permit for interfaces to access other interfaces on the same security level or lower.

- Inspection engines—Some application inspection engines are dependent on the security level. For same security interfaces, inspection engines apply to traffic in either direction.
  - NetBIOS inspection engine—Applied only for outbound connections.
  - SQL\*Net inspection engine—If a control connection for the SQL\*Net (formerly OraServ) port exists between a pair of hosts, then only an inbound data connection is permitted through the ASA.

- Filtering—HTTP(S) and FTP filtering applies only for outbound connections (from a higher level to a lower level).

If you enable communication for same security interfaces, you can filter traffic in either direction.

- **established** command—This command allows return connections from a lower security host to a higher security host if there is already an established connection from the higher level host to the lower level host.

If you enable communication for same security interfaces, you can configure **established** commands for both directions.

## Dual IP Stack (IPv4 and IPv6)

The ASA supports the configuration of both IPv6 and IPv4 on an interface. You do not need to enter any special commands to do so; simply enter the IPv4 configuration commands and IPv6 configuration commands as you normally would. Make sure you configure a default route for both IPv4 and IPv6.

# Licensing Requirements for Completing Interface Configuration in Routed Mode

| Model    | License Requirement                                                                                                                                                                                                                                                                                                                               |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ASA 5505 | <p>VLANs:</p> <p>Base License: 3 (2 regular zones and 1 restricted zone that can only communicate with 1 other zone)</p> <p>Security Plus License: 20</p> <p>VLAN Trunks:</p> <p>Base License: None.</p> <p>Security Plus License: 8.</p> <p>Interfaces of all types<sup>1</sup>:</p> <p>Base License: 52.</p> <p>Security Plus License: 120.</p> |

1. The maximum number of combined interfaces; for example, VLANs, physical, redundant, and bridge group interfaces.

| Model    | License Requirement                                                                                                                                                                                                                                                                                                                                    |

1. The maximum number of combined interfaces; for example, VLANs, physical, redundant, bridge group, and EtherChannel interfaces.

## Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

### Context Mode Guidelines

- For the ASA 5510 and higher in multiple context mode, configure the physical interfaces in the system execution space according to [Chapter 6, “Starting Interface Configuration \(ASA 5510 and Higher\).”](#) Then, configure the logical interface parameters in the context execution space according to this chapter.

The ASA 5505 does not support multiple context mode.

- In multiple context mode, you can only configure context interfaces that you already assigned to the context in the system configuration according to the [“Configuring Multiple Contexts” section on page 5-14.](#)
- PPPoE is not supported in multiple context mode.

### Firewall Mode Guidelines

Supported in routed firewall mode. For transparent mode, see [Chapter 9, “Completing Interface Configuration \(Transparent Mode\).”](#)

### Failover Guidelines

Do not finish configuring failover interfaces with the procedures in this chapter. See the [“Configuring Active/Standby Failover” section on page 61-7](#) or the [“Configuring Active/Active Failover” section on page 62-8](#) to configure the failover and state links. In multiple context mode, failover interfaces are configured in the system configuration.

**IPv6 Guidelines**

Supports IPv6.

## Default Settings

This section lists default settings for interfaces if you do not have a factory default configuration. For information about the factory default configurations, see the [“Factory Default Configurations” section on page 2-10](#).

**Default Security Level**

The default security level is 0. If you name an interface “inside” and you do not set the security level explicitly, then the ASA sets the security level to 100.

**Note**

If you change the security level of an interface, and you do not want to wait for existing connections to time out before the new security information is used, you can clear the connections using the **clear local-host** command.

## Completing Interface Configuration in Routed Mode

This section includes the following topics:

- [Task Flow for Completing Interface Configuration, page 8-5](#)
- [Configuring General Interface Parameters, page 8-6](#)
- [Configuring the MAC Address and MTU, page 8-8](#)
- [Configuring IPv6 Addressing, page 8-11](#)
- [Allowing Same Security Level Communication, page 8-14](#)

## Task Flow for Completing Interface Configuration

- 
- |               |                                                                                                                                                                                                                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | Set up your interfaces depending on your model: <ul style="list-style-type: none"><li>• ASA 5510 and higher—<a href="#">Chapter 6, “Starting Interface Configuration (ASA 5510 and Higher).”</a></li><li>• ASA 5505—<a href="#">Chapter 7, “Starting Interface Configuration (ASA 5505).”</a></li></ul>                 |
| <b>Step 2</b> | (Multiple context mode) Allocate interfaces to the context according to the <a href="#">“Configuring Multiple Contexts” section on page 5-14</a> .                                                                                                                                                                      |
| <b>Step 3</b> | (Multiple context mode) Enter the <b>changeto context name</b> command to change to the context you want to configure. Configure general interface parameters, including the interface name, security level, and IPv4 address. See the <a href="#">“Configuring General Interface Parameters” section on page 8-6</a> . |
| <b>Step 4</b> | (Optional) Configure the MAC address and the MTU. See the <a href="#">“Configuring the MAC Address and MTU” section on page 8-8</a> .                                                                                                                                                                                   |
| <b>Step 5</b> | (Optional) Configure IPv6 addressing. See the <a href="#">“Configuring IPv6 Addressing” section on page 8-11</a> .                                                                                                                                                                                                      |

- Step 6** (Optional) Allow same security level communication, either by allowing communication between two interfaces or by allowing traffic to enter and exit the same interface. See the [“Allowing Same Security Level Communication”](#) section on page 8-14.
- 

## Configuring General Interface Parameters

This procedure describes how to set the name, security level, IPv4 address and other options.

For the ASA 5510 and higher, you must configure interface parameters for the following interface types:

- Physical interfaces
- VLAN subinterfaces
- Redundant interfaces
- EtherChannel interfaces

For the ASA 5505, you must configure interface parameters for the following interface types:

- VLAN interfaces

### Guidelines and Limitations

- For the ASA 5550, for maximum throughput, be sure to balance your traffic over the two interface slots; for example, assign the inside interface to slot 1 and the outside interface to slot 0.
- If you are using failover, do not use this procedure to name interfaces that you are reserving for failover and Stateful Failover communications. See the [“Configuring Active/Standby Failover”](#) section on page 61-7 or the [“Configuring Active/Active Failover”](#) section on page 62-8 to configure the failover and state links.

### Restrictions

- PPPoE is not supported in multiple context mode.

### Prerequisites

- Set up your interfaces depending on your model:
  - ASA 5510 and higher—[Chapter 6, “Starting Interface Configuration \(ASA 5510 and Higher\).”](#)
  - ASA 5505—[Chapter 7, “Starting Interface Configuration \(ASA 5505\).”](#)
- In multiple context mode, you can only configure context interfaces that you already assigned to the context in the system configuration according to the [“Configuring Multiple Contexts”](#) section on page 5-14.
- In multiple context mode, complete this procedure in the context execution space. To change from the system to a context configuration, enter the **changeto context name** command.

## Detailed Steps

|               | Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p>For the ASA 5510 and higher:</p> <pre><b>interface</b> {{<b>redundant</b> <i>number</i>  <br/><b>port-channel</b> <i>number</i>  <br/><i>physical_interface</i>}[<i>.subinterface</i>]  <br/><i>mapped_name</i>}</pre> <p>For the ASA 5505:</p> <pre>hostname(config)# <b>interface</b> <b>vlan</b> <i>number</i></pre> <p><b>Example:</b></p> <pre>hostname(config)# interface<br/>gigabithethernet 0/0</pre>                                                                                | <p>If you are not already in interface configuration mode, enters interface configuration mode.</p> <p>The <b>redundant</b> <i>number</i> argument is the redundant interface ID, such as <b>redundant 1</b>.</p> <p>The <b>port-channel</b> <i>number</i> argument is the EtherChannel interface ID, such as <b>port-channel 1</b>.</p> <p>See the “<a href="#">Enabling the Physical Interface and Configuring Ethernet Parameters</a>” section for a description of the physical interface ID.</p> <p>Append the <i>subinterface</i> ID to the physical or redundant interface ID separated by a period (.).</p> <p>In multiple context mode, enter the <i>mapped_name</i> if one was assigned using the <b>allocate-interface</b> command.</p>                                                                                                                                                                                                                                                                      |
| <b>Step 2</b> | <pre><b>nameif</b> <i>name</i></pre> <p><b>Example:</b></p> <pre>hostname(config-if)# nameif inside</pre>                                                                                                                                                                                                                                                                                                                                                                                        | <p>Names the interface.</p> <p>The <i>name</i> is a text string up to 48 characters, and is not case-sensitive. You can change the name by reentering this command with a new value. Do not enter the <b>no</b> form, because that command causes all commands that refer to that name to be deleted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 3</b> | <p>Do one of the following:</p> <pre><b>ip address</b> <i>ip_address</i> [<i>mask</i>] [<b>standby</b><br/><i>ip_address</i>]</pre> <p><b>Example:</b></p> <pre>hostname(config-if)# ip address 10.1.1.1<br/>255.255.255.0 standby 10.1.1.2</pre> <pre><b>ip address dhcp</b> [<b>setroute</b>]</pre> <p><b>Example:</b></p> <pre>hostname(config-if)# ip address dhcp</pre> <p>To obtain an IP address from a PPPoE server, see <a href="#">Chapter 71, “Configuring the PPPoE Client.”</a></p> | <p>Sets the IP address manually.</p> <p><b>Note</b> For use with failover, you must set the IP address and standby address manually; DHCP and PPPoE are not supported.</p> <p>The <i>ip_address</i> and <i>mask</i> arguments set the interface IP address and subnet mask.</p> <p>The <b>standby</b> <i>ip_address</i> argument is used for failover. See the “<a href="#">Configuring Active/Standby Failover</a>” section on page 61-7 or the “<a href="#">Configuring Active/Active Failover</a>” section on page 62-8 for more information.</p> <p>Obtains an IP address from a DHCP server.</p> <p>The <b>setroute</b> keyword lets the ASA use the default route supplied by the DHCP server.</p> <p>Reenter this command to reset the DHCP lease and request a new lease.</p> <p>If you do not enable the interface using the <b>no shutdown</b> command before you enter the <b>ip address dhcp</b> command, some DHCP requests might not be sent.</p> <p>PPPoE is not supported in multiple context mode.</p> |

|        | Command                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                     |
|--------|---------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <b>security-level</b> <i>number</i><br><br><b>Example:</b><br>hostname(config-if)# security-level 50    | Sets the security level, where <i>number</i> is an integer between 0 (lowest) and 100 (highest). See the <a href="#">“Security Levels” section on page 8-1</a> .                                                                                                                                                            |
| Step 5 | (Optional)<br><br><b>management-only</b><br><br><b>Example:</b><br>hostname(config-if)# management-only | Sets an interface to management-only mode so that it does not pass through traffic.<br><br>By default, Management interfaces are configured as management-only. To disable this setting, enter the <b>no management-only</b> command.<br><br>The <b>management-only</b> command is not supported for a redundant interface. |

### Example

The following example configures parameters for VLAN 101:

```
hostname(config)# interface vlan 101
hostname(config-if)# nameif inside
hostname(config-if)# security-level 100
hostname(config-if)# ip address 10.1.1.1 255.255.255.0
```

The following example configures parameters in multiple context mode for the context configuration. The interface ID is a mapped name.

```
hostname/contextA(config)# interface int1
hostname/contextA(config-if)# nameif outside
hostname/contextA(config-if)# security-level 100
hostname/contextA(config-if)# ip address 10.1.2.1 255.255.255.0
```

### What to Do Next

- (Optional) Configure the MAC address and the MTU. See the [“Configuring the MAC Address and MTU” section on page 8-8](#).
- (Optional) Configure IPv6 addressing. See the [“Configuring IPv6 Addressing” section on page 8-11](#).

## Configuring the MAC Address and MTU

This section describes how to configure MAC addresses for interfaces and how to set the MTU.

### Information About MAC Addresses

By default, the physical interface uses the burned-in MAC address, and all subinterfaces of a physical interface use the same burned-in MAC address.

A redundant interface uses the MAC address of the first physical interface that you add. If you change the order of the member interfaces in the configuration, then the MAC address changes to match the MAC address of the interface that is now listed first. If you assign a MAC address to the redundant interface using this command, then it is used regardless of the member interface MAC addresses.

For an EtherChannel, all interfaces that are part of the channel group share the same MAC address. This feature makes the EtherChannel transparent to network applications and users, because they only see the one logical connection; they have no knowledge of the individual links. The port-channel interface uses the lowest numbered channel group interface MAC address as the port-channel MAC address.

Alternatively you can manually configure a MAC address for the port-channel interface. In multiple context mode, you can automatically assign unique MAC addresses to interfaces, including an EtherChannel port interface. We recommend manually, or in multiple context mode, automatically configuring a unique MAC address in case the group channel interface membership changes. If you remove the interface that was providing the port-channel MAC address, then the port-channel MAC address changes to the next lowest numbered interface, thus causing traffic disruption.

In multiple context mode, if you share an interface between contexts, you can assign a unique MAC address to the interface in each context. This feature lets the ASA easily classify packets into the appropriate context. Using a shared interface without unique MAC addresses is possible, but has some limitations. See the [“How the ASA Classifies Packets” section on page 5-3](#) for more information. You can assign each MAC address manually, or you can automatically generate MAC addresses for shared interfaces in contexts. See the [“Automatically Assigning MAC Addresses to Context Interfaces” section on page 5-23](#) to automatically generate MAC addresses. If you automatically generate MAC addresses, you can use this procedure to override the generated address.

For single context mode, or for interfaces that are not shared in multiple context mode, you might want to assign unique MAC addresses to subinterfaces. For example, your service provider might perform access control based on the MAC address.

## Information About the MTU

The MTU is the maximum datagram size that is sent on a connection. Data that is larger than the MTU value is fragmented before being sent.

The ASA supports IP path MTU discovery (as defined in RFC 1191), which allows a host to dynamically discover and cope with the differences in the maximum allowable MTU size of the various links along the path. Sometimes, the ASA cannot forward a datagram because the packet is larger than the MTU that you set for the interface, but the “don't fragment” (DF) bit is set. The network software sends a message to the sending host, alerting it to the problem. The host has to fragment packets for the destination so that they fit the smallest packet size of all the links along the path.

The default MTU is 1500 bytes in a block for Ethernet interfaces. This value is sufficient for most applications, but you can pick a lower number if network conditions require it.

To enable jumbo frames, see the [“Enabling Jumbo Frame Support \(Supported Models\)” section on page 6-31](#). A jumbo frame is an Ethernet packet larger than the standard maximum of 1518 bytes (including Layer 2 header and FCS), up to 9216 bytes. Jumbo frames require extra memory to process, and assigning more memory for jumbo frames might limit the maximum use of other features, such as access lists. To use jumbo frames, set the value higher, for example, to 9000 bytes.

## Prerequisites

- Set up your interfaces depending on your model:
  - ASA 5510 and higher—[Chapter 6, “Starting Interface Configuration \(ASA 5510 and Higher\).”](#)
  - ASA 5505—[Chapter 7, “Starting Interface Configuration \(ASA 5505\).”](#)
- In multiple context mode, you can only configure context interfaces that you already assigned to the context in the system configuration according to the [“Configuring Multiple Contexts” section on page 5-14](#).

- In multiple context mode, complete this procedure in the context execution space. To change from the system to a context configuration, enter the **changeto context name** command.

## Detailed Steps

|               | Command                                                                                                                                                                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p>For the ASA 5510 and higher:</p> <pre>interface {{<b>redundant</b> number  <br/><b>port-channel</b> number  <br/>physical_interface} [.subinterface]  <br/>mapped_name}</pre> <p>For the ASA 5505:</p> <pre>hostname(config)# <b>interface</b> <b>vlan</b> number</pre> <p><b>Example:</b></p> <pre>hostname(config)# interface vlan 100</pre> | <p>If you are not already in interface configuration mode, enters interface configuration mode.</p> <p>The <b>redundant number</b> argument is the redundant interface ID, such as <b>redundant 1</b>.</p> <p>The <b>port-channel number</b> argument is the EtherChannel interface ID, such as <b>port-channel 1</b>.</p> <p>See the “<a href="#">Enabling the Physical Interface and Configuring Ethernet Parameters</a>” section for a description of the physical interface ID.</p> <p>Append the <i>subinterface</i> ID to the physical or redundant interface ID separated by a period (.).</p> <p>In multiple context mode, enter the <i>mapped_name</i> if one was assigned using the <b>allocate-interface</b> command.</p> |
| <b>Step 2</b> | <pre><b>mac-address</b> mac_address<br/>[<b>standby</b> mac_address]</pre> <p><b>Example:</b></p> <pre>hostname(config-if)# mac-address<br/>000C.F142.4CDE</pre>                                                                                                                                                                                  | <p>Assigns a private MAC address to this interface. The <i>mac_address</i> is in H.H.H format, where H is a 16-bit hexadecimal digit. For example, the MAC address 00-0C-F1-42-4C-DE is entered as 000C.F142.4CDE.</p> <p>The first two bytes of a manual MAC address cannot be A2 if you also want to use auto-generated MAC addresses.</p> <p>For use with failover, set the <b>standby</b> MAC address. If the active unit fails over and the standby unit becomes active, the new active unit starts using the active MAC addresses to minimize network disruption, while the old active unit uses the standby address.</p>                                                                                                      |
| <b>Step 3</b> | <pre><b>mtu</b> interface_name bytes</pre> <p><b>Example:</b></p> <pre>hostname(config)# mtu inside 9200</pre>                                                                                                                                                                                                                                    | <p>Sets the MTU between 300 and 65,535 bytes. The default is 1500 bytes.</p> <p><b>Note</b> When you set the MTU for a redundant or port-channel interface, the ASA applies the setting to all member interfaces.</p> <p>For models that support jumbo frames, if you enter a value for any interface that is greater than 1500, then you need to enable jumbo frame support. See the “<a href="#">Enabling Jumbo Frame Support (Supported Models)</a>” section on page 6-31.</p>                                                                                                                                                                                                                                                    |

## What to Do Next

(Optional) Configure IPv6 addressing. See the “[Configuring IPv6 Addressing](#)” section on page 8-11.

## Configuring IPv6 Addressing

This section describes how to configure IPv6 addressing. For more information about IPv6, see the “[Information About IPv6 Support](#)” section on page 21-9 and the “[IPv6 Addresses](#)” section on page B-5.

This section includes the following topics:

- [Information About IPv6, page 8-11](#)
- [Configuring a Global IPv6 Address and Other Options, page 8-12](#)

### Information About IPv6

This section includes information about how to configure IPv6, and includes the following topics:

- [IPv6 Addressing, page 8-11](#)
- [Duplicate Address Detection, page 8-11](#)
- [Modified EUI-64 Interface IDs, page 8-12](#)

### IPv6 Addressing

You can configure two types of unicast addresses for IPv6:

- Global—The global address is a public address that you can use on the public network.
- Link-local—The link-local address is a private address that you can only use on the directly-connected network. Routers do not forward packets using link-local addresses; they are only for communication on a particular physical network segment. They can be used for address configuration or for the ND functions such as address resolution and neighbor discovery.

At a minimum, you need to configure a link-local addresses for IPv6 to operate. If you configure a global address, a link-local address is automatically configured on the interface, so you do not also need to specifically configure a link-local address. If you do not configure a global address, then you need to configure the link-local address, either automatically or manually.

**Note**

If you want to only configure the link-local addresses, see the **ipv6 enable** (to auto-configure) or **ipv6 address link-local** (to manually configure) command in the *Cisco ASA 5500 Series Command Reference*.

### Duplicate Address Detection

During the stateless autoconfiguration process, duplicate address detection (DAD) verifies the uniqueness of new unicast IPv6 addresses before the addresses are assigned to interfaces (the new addresses remain in a tentative state while duplicate address detection is performed). Duplicate address detection is performed first on the new link-local address. When the link-local address is verified as unique, then duplicate address detection is performed all the other IPv6 unicast addresses on the interface.

Duplicate address detection is suspended on interfaces that are administratively down. While an interface is administratively down, the unicast IPv6 addresses assigned to the interface are set to a pending state. An interface returning to an administratively up state restarts duplicate address detection for all of the unicast IPv6 addresses on the interface.

When a duplicate address is identified, the state of the address is set to DUPLICATE, the address is not used, and the following error message is generated:

```
%ASA-4-325002: Duplicate address ipv6_address/MAC_address on interface
```

If the duplicate address is the link-local address of the interface, the processing of IPv6 packets is disabled on the interface. If the duplicate address is a global address, the address is not used. However, all configuration commands associated with the duplicate address remain as configured while the state of the address is set to DUPLICATE.

If the link-local address for an interface changes, duplicate address detection is performed on the new link-local address and all of the other IPv6 address associated with the interface are regenerated (duplicate address detection is performed only on the new link-local address).

The ASA uses neighbor solicitation messages to perform duplicate address detection. By default, the number of times an interface performs duplicate address detection is 1.

## Modified EUI-64 Interface IDs

RFC 3513: Internet Protocol Version 6 (IPv6) Addressing Architecture requires that the interface identifier portion of all unicast IPv6 addresses, except those that start with binary value 000, be 64 bits long and be constructed in Modified EUI-64 format. The ASA can enforce this requirement for hosts attached to the local link.

When this feature is enabled on an interface, the source addresses of IPv6 packets received on that interface are verified against the source MAC addresses to ensure that the interface identifiers use the Modified EUI-64 format. If the IPv6 packets do not use the Modified EUI-64 format for the interface identifier, the packets are dropped and the following system log message is generated:

```
%ASA-3-325003: EUI-64 source address check failed.
```

The address format verification is only performed when a flow is created. Packets from an existing flow are not checked. Additionally, the address verification can only be performed for hosts on the local link. Packets received from hosts behind a router will fail the address format verification, and be dropped, because their source MAC address will be the router MAC address and not the host MAC address.

## Configuring a Global IPv6 Address and Other Options

To configure a global IPv6 address and other options, perform the following steps.

### Note

Configuring the global address automatically configures the link-local address, so you do not need to configure it separately.

## Restrictions

The ASA does not support IPv6 anycast addresses.

## Prerequisites

- Set up your interfaces depending on your model:
  - ASA 5510 and higher—[Chapter 6, “Starting Interface Configuration \(ASA 5510 and Higher\).”](#)
  - ASA 5505—[Chapter 7, “Starting Interface Configuration \(ASA 5505\).”](#)
- In multiple context mode, you can only configure context interfaces that you already assigned to the context in the system configuration according to the [“Configuring Multiple Contexts” section on page 5-14.](#)

- In multiple context mode, complete this procedure in the context execution space. To change from the system to a context configuration, enter the **changeto context name** command.

## Detailed Steps

| Command                                                                                                                                                                                                                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Step 1</b></p> <p>For the ASA 5510 and higher:</p> <pre>interface {{<b>redundant</b> number  <br/><b>port-channel</b> number  <br/>physical_interface} [.subinterface]  <br/>mapped_name}</pre> <p>For the ASA 5505:</p> <pre>hostname(config)# <b>interface</b> vlan number</pre> <p><b>Example:</b></p> <pre>hostname(config)# interface<br/>gigabithethernet 0/0</pre> | <p>If you are not already in interface configuration mode, enters interface configuration mode.</p> <p>The <b>redundant number</b> argument is the redundant interface ID, such as <b>redundant 1</b>.</p> <p>The <b>port-channel number</b> argument is the EtherChannel interface ID, such as <b>port-channel 1</b>.</p> <p>See the <a href="#">“Enabling the Physical Interface and Configuring Ethernet Parameters”</a> section for a description of the physical interface ID.</p> <p>Append the <i>subinterface</i> ID to the physical or redundant interface ID separated by a period (.).</p> <p>In multiple context mode, enter the <i>mapped_name</i> if one was assigned using the <b>allocate-interface</b> command.</p> |
| <p><b>Step 2</b></p> <p>Do one of the following:</p> <p><b>ipv6 address autoconfig</b></p> <p><b>Example:</b></p> <pre>hostname(config-if)# ipv6 address<br/>autoconfig</pre>                                                                                                                                                                                                   | <p>Enables stateless autoconfiguration on the interface. Enabling stateless autoconfiguration on the interface configures IPv6 addresses based on prefixes received in Router Advertisement messages. A link-local address, based on the Modified EUI-64 interface ID, is automatically generated for the interface when stateless autoconfiguration is enabled.</p> <p><b>Note</b> Although RFC 4862 specifies that hosts configured for stateless autoconfiguration do not send Router Advertisement messages, the ASA does send Router Advertisement messages in this case. See the <b>ipv6 nd suppress-ra</b> command to suppress messages.</p>                                                                                  |
| <p><b>ipv6 address</b> <i>ipv6-prefix/prefix-length</i> [<b>eui-64</b>] [<b>standby</b> <i>ipv6-prefix</i>]</p> <p><b>Example:</b></p> <pre>hostname(config-if)# ipv6 address<br/>2001:0DB8::BA98:0:3210/48</pre>                                                                                                                                                               | <p>Assigns a global address to the interface. When you assign a global address, the link-local address is automatically created for the interface. Use the optional <b>eui-64</b> keyword to use the Modified EUI-64 interface ID in the low order 64 bits of the address.</p> <p><b>standby</b> specifies the interface address used by the secondary unit or failover group in a failover pair. If the <b>eui-64</b> option is used, you do not need to specify the standby address; the link-local address of the interface will be used.</p> <p>See the <a href="#">“IPv6 Addresses”</a> section on page B-5 for more information about IPv6 addressing.</p>                                                                     |

|               | Command                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | (Optional)<br><code>ipv6 nd suppress-ra</code><br><br><b>Example:</b><br><code>hostname(config-if)# ipv6 nd suppress-ra</code>            | Suppresses Router Advertisement messages on an interface. By default, Router Advertisement messages are automatically sent in response to router solicitation messages. You may want to disable these messages on any interface for which you do not want the ASA to supply the IPv6 prefix (for example, the outside interface).                                                                                                                                                                                                                                                                             |
| <b>Step 4</b> | (Optional)<br><code>ipv6 nd dad attempts value</code><br><br><b>Example:</b><br><code>hostname(config-if)# ipv6 nd dad attempts 3</code>  | Changes the number of duplicate address detection attempts. The <i>value</i> argument can be any value from 0 to 600. Setting the <i>value</i> argument to 0 disables duplicate address detection on the interface.<br><br>By default, the number of times an interface performs duplicate address detection is 1. See the <a href="#">“Duplicate Address Detection” section on page 8-11</a> for more information.                                                                                                                                                                                           |
| <b>Step 5</b> | (Optional)<br><code>ipv6 nd ns-interval value</code><br><br><b>Example:</b><br><code>hostname(config-if)# ipv6 nd ns-interval 2000</code> | Changes the neighbor solicitation message interval. When you configure an interface to send out more than one duplicate address detection attempt with the <code>ipv6 nd dad attempts</code> command, this command configures the interval at which the neighbor solicitation messages are sent out. By default, they are sent out once every 1000 milliseconds. The <i>value</i> argument can be from 1000 to 3600000 milliseconds.<br><br><b>Note</b> Changing this value changes it for all neighbor solicitation messages sent out on the interface, not just those used for duplicate address detection. |
| <b>Step 6</b> | (Optional)<br><code>ipv6 enforce-eui64 if_name</code><br><br><b>Example:</b><br><code>hostname(config)# ipv6 enforce-eui64 inside</code>  | Enforces the use of Modified EUI-64 format interface identifiers in IPv6 addresses on a local link.<br><br>The <i>if_name</i> argument is the name of the interface, as specified by the <code>nameif</code> command, on which you are enabling the address format enforcement.<br><br>See the <a href="#">“Modified EUI-64 Interface IDs” section on page 8-12</a> for more information.                                                                                                                                                                                                                     |

## Allowing Same Security Level Communication

By default, interfaces on the same security level cannot communicate with each other, and packets cannot enter and exit the same interface. This section describes how to enable inter-interface communication when interfaces are on the same security level, and how to enable intra-interface communication.

### Information About Inter-Interface Communication

Allowing interfaces on the same security level to communicate with each other provides the following benefits:

- You can configure more than 101 communicating interfaces.  
If you use different levels for each interface and do not assign any interfaces to the same security level, you can configure only one interface per level (0 to 100).
- You want traffic to flow freely between all same security interfaces without access lists.

If you enable same security interface communication, you can still configure interfaces at different security levels as usual.

### Information About Intra-Interface Communication

Intra-interface communication might be useful for VPN traffic that enters an interface, but is then routed out the same interface. The VPN traffic might be unencrypted in this case, or it might be reencrypted for another VPN connection. For example, if you have a hub and spoke VPN network, where the ASA is the hub, and remote VPN networks are spokes, for one spoke to communicate with another spoke, traffic must go into the ASA and then out again to the other spoke.

#### Note

All traffic allowed by this feature is still subject to firewall rules. Be careful not to create an asymmetric routing situation that can cause return traffic not to traverse the ASA.

### Detailed Steps

| Command                                                   | Purpose                                                                                     |
|-----------------------------------------------------------|---------------------------------------------------------------------------------------------|
| <code>same-security-traffic permit inter-interface</code> | Enables interfaces on the same security level so that they can communicate with each other. |
| <code>same-security-traffic permit intra-interface</code> | Enables communication between hosts connected to the same interface.                        |

## Monitoring Interfaces

To monitor interfaces, enter one of the following commands:

| Command                              | Purpose                                     |
|--------------------------------------|---------------------------------------------|
| <code>show interface</code>          | Displays interface statistics.              |
| <code>show interface ip brief</code> | Displays interface IP addresses and status. |

## Configuration Examples for Interfaces in Routed Mode

This section includes the following topics:

- [ASA 5505 Example, page 8-15](#)

### ASA 5505 Example

The following example configures three VLAN interfaces for the Base license. The third home interface cannot forward traffic to the business interface.

```
hostname(config)# interface vlan 100
```

```

hostname(config-if)# nameif outside
hostname(config-if)# security-level 0
hostname(config-if)# ip address dhcp
hostname(config-if)# no shutdown

hostname(config-if)# interface vlan 200
hostname(config-if)# nameif business
hostname(config-if)# security-level 100
hostname(config-if)# ip address 10.1.1.1 255.255.255.0
hostname(config-if)# no shutdown

hostname(config-if)# interface vlan 300
hostname(config-if)# no forward interface vlan 200
hostname(config-if)# nameif home
hostname(config-if)# security-level 50
hostname(config-if)# ip address 10.2.1.1 255.255.255.0
hostname(config-if)# no shutdown

```

# Feature History for Interfaces in Routed Mode

Table 8-1 lists the release history for this feature.

**Table 8-1** Feature History for Interfaces

| Feature Name    | Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Increased VLANs | 7.0(5)   | <p>Increased the following limits:</p> <ul style="list-style-type: none"> <li>ASA5510 Base license VLANs from 0 to 10.</li> <li>ASA5510 Security Plus license VLANs from 10 to 25.</li> <li>ASA5520 VLANs from 25 to 100.</li> <li>ASA5540 VLANs from 100 to 200.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Increased VLANs | 7.2(2)   | <p>The maximum number of VLANs for the Security Plus license on the ASA 5505 was increased from 5 (3 fully functional; 1 failover; one restricted to a backup interface) to 20 fully functional interfaces. In addition, the number of trunk ports was increased from 1 to 8. Now there are 20 fully functional interfaces, you do not need to use the backup interface command to cripple a backup ISP interface; you can use a fully-functional interface for it. The backup interface command is still useful for an Easy VPN configuration.</p> <p>VLAN limits were also increased for the ASA 5510 (from 10 to 50 for the Base license, and from 25 to 100 for the Security Plus license), the ASA 5520 (from 100 to 150), the ASA 5550 (from 200 to 250).</p> |

**Table 8-1**      *Feature History for Interfaces (continued)*

| Feature Name                                                                             | Releases      | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------------------------------------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Gigabit Ethernet Support for the ASA 5510 Security Plus License                          | 7.2(3)        | The ASA 5510 now supports GE (Gigabit Ethernet) for port 0 and 1 with the Security Plus license. If you upgrade the license from Base to Security Plus, the capacity of the external Ethernet0/0 and Ethernet0/1 ports increases from the original FE (Fast Ethernet) (100 Mbps) to GE (1000 Mbps). The interface names will remain Ethernet 0/0 and Ethernet 0/1. Use the <b>speed</b> command to change the speed on the interface and use the <b>show interface</b> command to see what speed is currently configured for each interface. |
| Native VLAN support for the ASA 5505                                                     | 7.2(4)/8.0(4) | You can now include the native VLAN in an ASA 5505 trunk port.<br><br>We introduced the following command: <b>switchport trunk native vlan</b> .                                                                                                                                                                                                                                                                                                                                                                                             |
| Jumbo packet support for the ASA 5580                                                    | 8.1(1)        | The Cisco ASA 5580 supports jumbo frames. A jumbo frame is an Ethernet packet larger than the standard maximum of 1518 bytes (including Layer 2 header and FCS), up to 9216 bytes. You can enable support for jumbo frames for all interfaces by increasing the amount of memory to process Ethernet frames. Assigning more memory for jumbo frames might limit the maximum use of other features, such as access lists.<br><br>We introduced the following command: <b>jumbo-frame reservation</b> .                                        |
| Increased VLANs for the ASA 5580                                                         | 8.1(2)        | The number of VLANs supported on the ASA 5580 are increased from 100 to 250.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| IPv6 support for transparent mode                                                        | 8.2(1)        | IPv6 support was introduced for transparent firewall mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Support for Pause Frames for Flow Control on the ASA 5580 10 Gigabit Ethernet Interfaces | 8.2(2)        | You can now enable pause (XOFF) frames for flow control.<br><br>We introduced the following command: <b>flowcontrol</b> .                                                                                                                                                                                                                                                                                                                                                                                                                    |

## CHAPTER 9

# Completing Interface Configuration (Transparent Mode)

---

This chapter includes tasks to complete the interface configuration for all models in transparent firewall mode.

This chapter includes the following sections:

- [Information About Completing Interface Configuration in Transparent Mode, page 9-1](#)
- [Licensing Requirements for Completing Interface Configuration in Transparent Mode, page 9-2](#)
- [Guidelines and Limitations, page 9-4](#)
- [Default Settings, page 9-5](#)
- [Completing Interface Configuration in Transparent Mode, page 9-6](#)
- [Monitoring Interfaces, page 9-18](#)
- [Configuration Examples for Interfaces in Transparent Mode, page 9-18](#)
- [Feature History for Interfaces in Transparent Mode, page 9-19](#)

### Note

For multiple context mode, complete the tasks in this section in the context execution space. Enter the **changeto context *name*** command to change to the context you want to configure.

---

## Information About Completing Interface Configuration in Transparent Mode

This section includes the following topics:

- [Bridge Groups in Transparent Mode, page 9-1](#)
- [Security Levels, page 9-2](#)

### Bridge Groups in Transparent Mode

If you do not want the overhead of security contexts, or want to maximize your use of security contexts, you can group interfaces together in a bridge group, and then configure multiple bridge groups, one for each network. Bridge group traffic is isolated from other bridge groups; traffic is not routed to another bridge group within the ASA, and traffic must exit the ASA before it is routed by an external router back

to another bridge group in the ASA. Although the bridging functions are separate for each bridge group, many other functions are shared between all bridge groups. For example, all bridge groups share a syslog server or AAA server configuration. For complete security policy separation, use security contexts with one bridge group in each context. At least one bridge group is required per context or in single mode.

Each bridge group requires a management IP address. For another method of management, see the [“Management Interface”](#) section.

**Note**

The ASA does not support traffic on secondary networks; only traffic on the same network as the management IP address is supported.

## Security Levels

Each interface must have a security level from 0 (lowest) to 100 (highest). For example, you should assign your most secure network, such as the inside host network, to level 100. While the outside network connected to the Internet can be level 0. Other networks, such as DMZs can be in between. You can assign interfaces to the same security level. See the [“Allowing Same Security Level Communication”](#) section on page 9-17 for more information.

The level controls the following behavior:

- Network access—By default, there is an implicit permit from a higher security interface to a lower security interface (outbound). Hosts on the higher security interface can access any host on a lower security interface. You can limit access by applying an access list to the interface.

If you enable communication for same security interfaces (see the [“Allowing Same Security Level Communication”](#) section on page 9-17), there is an implicit permit for interfaces to access other interfaces on the same security level or lower.

- Inspection engines—Some application inspection engines are dependent on the security level. For same security interfaces, inspection engines apply to traffic in either direction.
  - NetBIOS inspection engine—Applied only for outbound connections.
  - SQL\*Net inspection engine—If a control connection for the SQL\*Net (formerly OraServ) port exists between a pair of hosts, then only an inbound data connection is permitted through the ASA.
- Filtering—HTTP(S) and FTP filtering applies only for outbound connections (from a higher level to a lower level).

If you enable communication for same security interfaces, you can filter traffic in either direction.

- **established** command—This command allows return connections from a lower security host to a higher security host if there is already an established connection from the higher level host to the lower level host.

If you enable communication for same security interfaces, you can configure **established** commands for both directions.

## Licensing Requirements for Completing Interface Configuration in Transparent Mode

| Model    | License Requirement                                                                                                                                                                                                                                                                                                                               |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ASA 5505 | <p>VLANs:</p> <p>Base License: 3 (2 regular zones and 1 restricted zone that can only communicate with 1 other zone)</p> <p>Security Plus License: 20</p> <p>VLAN Trunks:</p> <p>Base License: None.</p> <p>Security Plus License: 8.</p> <p>Interfaces of all types<sup>1</sup>:</p> <p>Base License: 52.</p> <p>Security Plus License: 120.</p> |

1. The maximum number of combined interfaces; for example, VLANs, physical, redundant, and bridge group interfaces.

| Model    | License Requirement                                                                                                                                                                                                                                                                                                                                    |

1. The maximum number of combined interfaces; for example, VLANs, physical, redundant, bridge group, and EtherChannel interfaces.

## Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

### Context Mode Guidelines

- For the ASA 5510 and higher in multiple context mode, configure the physical interfaces in the system execution space according to [Chapter 6, “Starting Interface Configuration \(ASA 5510 and Higher\).”](#) Then, configure the logical interface parameters in the context execution space according to this chapter.

The ASA 5505 does not support multiple context mode.

- You can only configure context interfaces that you already assigned to the context in the system configuration using the **allocate-interface** command.

### Firewall Mode Guidelines

- You can configure up to 8 bridge groups in single mode or per context in multiple mode. Note that you must use at least 1 bridge group; data interfaces must belong to a bridge group.

#### Note

Although you can configure multiple bridge groups on the ASA 5505, the restriction of 2 data interfaces in transparent mode on the ASA 5505 means you can only effectively use 1 bridge group.

- Each bridge group can include up to 4 interfaces.
- For IPv4, a management IP address is required for each bridge group for both management traffic and for traffic to pass through the ASA.

Unlike routed mode, which requires an IP address for each interface, a transparent firewall has an IP address assigned to the entire bridge group. The ASA uses this IP address as the source address for packets originating on the ASA, such as system messages or AAA communications. In addition to the bridge group management address, you can optionally configure a management interface for some models; see the [“Management Interface” section on page 6-2](#) for more information.

The management IP address must be on the same subnet as the connected network. You cannot set the subnet to a host subnet (255.255.255.255). The ASA does not support traffic on secondary networks; only traffic on the same network as the management IP address is supported. See the [“Configuring Bridge Groups” section on page 9-6](#) for more information about management IP subnets.

- For IPv6, at a minimum you need to configure link-local addresses for each interface for through traffic. For full functionality, including the ability to manage the ASA, you need to configure a global IPv6 address for each bridge group.
- For multiple context mode, each context must use different interfaces; you cannot share an interface across contexts.
- For multiple context mode, each context typically uses a different subnet. You can use overlapping subnets, but your network topology requires router and NAT configuration to make it possible from a routing standpoint.

#### Failover Guidelines

Do not finish configuring failover interfaces with the procedures in this chapter. See the [“Configuring Active/Standby Failover” section on page 61-7](#) or the [“Configuring Active/Active Failover” section on page 62-8](#) to configure the failover and state links. In multiple context mode, failover interfaces are configured in the system configuration.

#### IPv6 Guidelines

- Supports IPv6.
- No support for IPv6 anycast addresses in transparent mode.

## Default Settings

This section lists default settings for interfaces if you do not have a factory default configuration. For information about the factory default configurations, see the [“Factory Default Configurations” section on page 2-10](#).

#### Default Security Level

The default security level is 0. If you name an interface “inside” and you do not set the security level explicitly, then the ASA sets the security level to 100.

#### Note

If you change the security level of an interface, and you do not want to wait for existing connections to time out before the new security information is used, you can clear the connections using the **clear local-host** command.

# Completing Interface Configuration in Transparent Mode

This section includes the following topics:

- [Task Flow for Completing Interface Configuration, page 9-6](#)
- [Configuring Bridge Groups, page 9-6](#)
- [Configuring General Interface Parameters, page 9-7](#)
- [Configuring a Management Interface \(ASA 5510 and Higher\), page 9-10](#)
- [Configuring the MAC Address and MTU, page 9-11](#)
- [Configuring IPv6 Addressing, page 9-13](#)
- [Allowing Same Security Level Communication, page 9-17](#)

## Task Flow for Completing Interface Configuration

- 
- |               |                                                                                                                                                                                                                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | Set up your interfaces depending on your model: <ul style="list-style-type: none"> <li>• ASA 5510 and higher—<a href="#">Chapter 6, “Starting Interface Configuration (ASA 5510 and Higher).”</a></li> <li>• ASA 5505—<a href="#">Chapter 7, “Starting Interface Configuration (ASA 5505).”</a></li> </ul> |
| <b>Step 2</b> | (Multiple context mode) Allocate interfaces to the context according to the <a href="#">“Configuring Multiple Contexts”</a> section on page 5-14.                                                                                                                                                          |
| <b>Step 3</b> | (Multiple context mode) Enter the <b>changeto context</b> <i>name</i> command to change to the context you want to configure. Configure one or more bridge groups, including the IPv4 address. See the <a href="#">“Configuring Bridge Groups”</a> section on page 9-6.                                    |
| <b>Step 4</b> | Configure general interface parameters, including the interface name and security level. See the <a href="#">“Configuring General Interface Parameters”</a> section on page 9-7.                                                                                                                           |
| <b>Step 5</b> | (Optional; not supported for the ASA 5505) Configure a management interface. See the <a href="#">“Configuring a Management Interface (ASA 5510 and Higher)”</a> section on page 9-10.                                                                                                                      |
| <b>Step 6</b> | (Optional) Configure the MAC address and the MTU. See the <a href="#">“Configuring the MAC Address and MTU”</a> section on page 9-11.                                                                                                                                                                      |
| <b>Step 7</b> | (Optional) Configure IPv6 addressing. See the <a href="#">“Configuring IPv6 Addressing”</a> section on page 9-13.                                                                                                                                                                                          |
| <b>Step 8</b> | (Optional) Allow same security level communication, either by allowing communication between two interfaces or by allowing traffic to enter and exit the same interface. See the <a href="#">“Allowing Same Security Level Communication”</a> section on page 9-17.                                        |
- 

## Configuring Bridge Groups

Each bridge group requires a management IP address. The ASA uses this IP address as the source address for packets originating from the bridge group. The management IP address must be on the same subnet as the connected network. For IPv4 traffic, the management IP address is required to pass any traffic. For IPv6 traffic, you must, at a minimum, configure the link-local addresses to pass traffic, but a global management address is recommended for full functionality, including remote management and other management operations.

## Guidelines and Limitations

You can configure up to 8 bridge groups in single mode or per context in multiple mode. Note that you must use at least one bridge group; data interfaces must belong to a bridge group.

### Note

For a separate management interface (for supported models), a non-configurable bridge group (ID 101) is automatically added to your configuration. This bridge group is not included in the bridge group limit.

## Detailed Steps

|        | Command                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|-----------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>interface bvi</b> <i>bridge_group_number</i>                                               | Creates a bridge group, where <i>bridge_group_number</i> is an integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|        | <b>Example:</b><br>hostname(config)# interface bvi 1                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Step 2 | <b>ip address</b> <i>ip_address</i> [ <i>mask</i> ]<br>[ <b>standby</b> <i>ip_address</i> ]   | Specifies the management IP address for the bridge group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|        | <b>Example:</b><br>hostname(config-if)# ip address 10.1.3.1<br>255.255.255.0 standby 10.1.3.2 | Do not assign a host address (/32 or 255.255.255.255) to the bridge group. Also, do not use other subnets that contain fewer than 3 host addresses (one each for the upstream router, downstream router, and transparent firewall) such as a /30 subnet (255.255.255.252). The ASA drops all ARP packets to or from the first and last addresses in a subnet. Therefore, if you use a /30 subnet and assign a reserved address from that subnet to the upstream router, then the ASA drops the ARP request from the downstream router to the upstream router. |
|        |                                                                                               | The ASA does not support traffic on secondary networks; only traffic on the same network as the management IP address is supported.                                                                                                                                                                                                                                                                                                                                                                                                                           |
|        |                                                                                               | The <b>standby</b> keyword and address is used for failover.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Examples

The following example sets the management address and standby address of bridge group 1:

```
hostname(config)# interface bvi 1
hostname(config-if)# ip address 10.1.3.1 255.255.255.0 standby 10.1.3.2
```

## What to Do Next

Configure general interface parameters. See the [“Configuring General Interface Parameters”](#) section on page 9-7.

# Configuring General Interface Parameters

This procedure describes how to set the name, security level, and bridge group for each transparent interface.

To configure a separate management interface, see the [“Configuring a Management Interface \(ASA 5510 and Higher\)” section on page 9-10](#).

For the ASA 5510 and higher, you must configure interface parameters for the following interface types:

- Physical interfaces
- VLAN subinterfaces
- Redundant interfaces
- EtherChannel interfaces

For the ASA 5505, you must configure interface parameters for the following interface types:

- VLAN interfaces

## Guidelines and Limitations

- You can configure up to four interfaces per bridge group.
- For the ASA 5550, for maximum throughput, be sure to balance your traffic over the two interface slots; for example, assign the inside interface to slot 1 and the outside interface to slot 0.
- For information about security levels, see the [“Security Levels” section on page 9-2](#).
- If you are using failover, do not use this procedure to name interfaces that you are reserving for failover and Stateful Failover communications. See the [“Configuring Active/Standby Failover” section on page 61-7](#) or the [“Configuring Active/Active Failover” section on page 62-8](#) to configure the failover and state links.

## Prerequisites

- Set up your interfaces depending on your model:
  - ASA 5510 and higher—[Chapter 6, “Starting Interface Configuration \(ASA 5510 and Higher\).”](#)
  - ASA 5505—[Chapter 7, “Starting Interface Configuration \(ASA 5505\).”](#)
- In multiple context mode, you can only configure context interfaces that you already assigned to the context in the system configuration according to the [“Configuring Multiple Contexts” section on page 5-14](#).
- In multiple context mode, complete this procedure in the context execution space. To change from the system to a context configuration, enter the **changeto context name** command.

## Detailed Steps

|               | Command                                                                                                                                                                                                                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p>For the ASA 5510 and higher:</p> <pre><b>interface</b> {{<b>redundant</b> <i>number</i>  <br/><b>port-channel</b> <i>number</i>  <br/><i>physical_interface</i>}[.<i>subinterface</i>]  <br/><i>mapped_name</i>}</pre> <p>For the ASA 5505:</p> <pre>hostname(config)# <b>interface</b> <b>vlan</b> <i>number</i></pre> <p><b>Example:</b></p> <pre>hostname(config)# interface vlan 100</pre> | <p>If you are not already in interface configuration mode, enters interface configuration mode.</p> <p>The <b>redundant</b> <i>number</i> argument is the redundant interface ID, such as <b>redundant 1</b>.</p> <p>The <b>port-channel</b> <i>number</i> argument is the EtherChannel interface ID, such as <b>port-channel 1</b>.</p> <p>See the “<a href="#">Enabling the Physical Interface and Configuring Ethernet Parameters</a>” section for a description of the physical interface ID. Do not use this procedure for Management interfaces; see the “<a href="#">Configuring a Management Interface (ASA 5510 and Higher)</a>” section on page 9-10 to configure the Management interface.</p> <p>Append the <i>subinterface</i> ID to the physical or redundant interface ID separated by a period (.).</p> <p>In multiple context mode, enter the <i>mapped_name</i> if one was assigned using the <b>allocate-interface</b> command.</p> |
| <b>Step 2</b> | <pre><b>bridge-group</b> <i>number</i></pre> <p><b>Example:</b></p> <pre>hostname(config-if)# bridge-group 1</pre>                                                                                                                                                                                                                                                                                | <p>Assigns the interface to a bridge group, where <i>number</i> is an integer between 1 and 100. You can assign up to four interfaces to a bridge group. You cannot assign the same interface to more than one bridge group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 3</b> | <pre><b>nameif</b> <i>name</i></pre> <p><b>Example:</b></p> <pre>hostname(config-if)# nameif inside</pre>                                                                                                                                                                                                                                                                                         | <p>Names the interface.</p> <p>The <i>name</i> is a text string up to 48 characters, and is not case-sensitive. You can change the name by reentering this command with a new value. Do not enter the <b>no</b> form, because that command causes all commands that refer to that name to be deleted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 4</b> | <pre><b>security-level</b> <i>number</i></pre> <p><b>Example:</b></p> <pre>hostname(config-if)# security-level 50</pre>                                                                                                                                                                                                                                                                           | <p>Sets the security level, where <i>number</i> is an integer between 0 (lowest) and 100 (highest).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## What to Do Next

- (Optional) Configure a management interface. See the “[Configuring a Management Interface \(ASA 5510 and Higher\)](#)” section on page 9-10.
- (Optional) Configure the MAC address and the MTU. See the “[Configuring the MAC Address and MTU](#)” section on page 9-11.
- (Optional) Configure IPv6 addressing. See the “[Configuring IPv6 Addressing](#)” section on page 9-13.

| Command                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip address</b> <i>ip_address</i> [ <i>mask</i> ] [ <b>standby</b> <i>ip_address</i> ]<br><br><b>Example:</b><br><pre>hostname(config-if)# ip address 10.1.1.1 255.255.255.0 standby 10.1.1.2</pre> | <p>Sets the IP address manually.</p> <p><b>Note</b> For use with failover, you must set the IP address and standby address manually; DHCP is not supported.</p> <p>The <i>ip_address</i> and <i>mask</i> arguments set the interface IP address and subnet mask.</p> <p>The <b>standby</b> <i>ip_address</i> argument is used for failover. | <b>Step 4</b> <b>security-level</b> <i>number</i><br><br><b>Example:</b><br><pre>hostname(config-if)# security-level 50</pre>                                                                         | <p>Sets the security level, where <i>number</i> is an integer between 0 (lowest) and 100 (highest).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## What to Do Next

- (Optional) Configure the MAC address and the MTU. See the [“Configuring the MAC Address and MTU” section on page 9-11](#).
- (Optional) Configure IPv6 addressing. See the [“Configuring IPv6 Addressing” section on page 9-13](#).

## Configuring the MAC Address and MTU

This section describes how to configure MAC addresses for interfaces and how to set the MTU.

### Information About MAC Addresses

By default, the physical interface uses the burned-in MAC address, and all subinterfaces of a physical interface use the same burned-in MAC address.

A redundant interface uses the MAC address of the first physical interface that you add. If you change the order of the member interfaces in the configuration, then the MAC address changes to match the MAC address of the interface that is now listed first. If you assign a MAC address to the redundant interface using this command, then it is used regardless of the member interface MAC addresses.

For an EtherChannel, all interfaces that are part of the channel group share the same MAC address. This feature makes the EtherChannel transparent to network applications and users, because they only see the one logical connection; they have no knowledge of the individual links. The port-channel interface uses the lowest numbered channel group interface MAC address as the port-channel MAC address.

Alternatively you can manually configure a MAC address for the port-channel interface. In multiple context mode, you can automatically assign unique MAC addresses to interfaces, including an EtherChannel port interface. We recommend manually, or in multiple context mode, automatically configuring a unique MAC address in case the group channel interface membership changes. If you remove the interface that was providing the port-channel MAC address, then the port-channel MAC address changes to the next lowest numbered interface, thus causing traffic disruption.

In multiple context mode, if you share an interface between contexts, you can assign a unique MAC address to the interface in each context. This feature lets the ASA easily classify packets into the appropriate context. Using a shared interface without unique MAC addresses is possible, but has some limitations. See the [“How the ASA Classifies Packets” section on page 5-3](#) for more information. You can assign each MAC address manually, or you can automatically generate MAC addresses for shared interfaces in contexts. See the [“Automatically Assigning MAC Addresses to Context Interfaces” section on page 5-23](#) to automatically generate MAC addresses. If you automatically generate MAC addresses, you can use this procedure to override the generated address.

For single context mode, or for interfaces that are not shared in multiple context mode, you might want to assign unique MAC addresses to subinterfaces. For example, your service provider might perform access control based on the MAC address.

## Information About the MTU

The MTU is the maximum datagram size that is sent on a connection. Data that is larger than the MTU value is fragmented before being sent.

The ASA supports IP path MTU discovery (as defined in RFC 1191), which allows a host to dynamically discover and cope with the differences in the maximum allowable MTU size of the various links along the path. Sometimes, the ASA cannot forward a datagram because the packet is larger than the MTU that you set for the interface, but the “don't fragment” (DF) bit is set. The network software sends a message to the sending host, alerting it to the problem. The host has to fragment packets for the destination so that they fit the smallest packet size of all the links along the path.

The default MTU is 1500 bytes in a block for Ethernet interfaces. This value is sufficient for most applications, but you can pick a lower number if network conditions require it.

To enable jumbo frames, see the [“Enabling Jumbo Frame Support \(Supported Models\)” section on page 6-31](#). A jumbo frame is an Ethernet packet larger than the standard maximum of 1518 bytes (including Layer 2 header and FCS), up to 9216 bytes. Jumbo frames require extra memory to process, and assigning more memory for jumbo frames might limit the maximum use of other features, such as access lists. To use jumbo frames, set the value higher, for example, to 9000 bytes.

## Prerequisites

- Set up your interfaces depending on your model:
  - ASA 5510 and higher—[Chapter 6, “Starting Interface Configuration \(ASA 5510 and Higher\).”](#)
  - ASA 5505—[Chapter 7, “Starting Interface Configuration \(ASA 5505\).”](#)
- In multiple context mode, you can only configure context interfaces that you already assigned to the context in the system configuration according to the [“Configuring Multiple Contexts” section on page 5-14](#).
- In multiple context mode, complete this procedure in the context execution space. To change from the system to a context configuration, enter the **changeto context name** command.

## Detailed Steps

|               | Command                                                                                                                                                                                                                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p>For the ASA 5510 and higher:</p> <pre><b>interface</b> {{<b>redundant</b> <i>number</i>  <br/><b>port-channel</b> <i>number</i>  <br/><i>physical_interface</i>}[.<i>subinterface</i>]  <br/><i>mapped_name</i>}</pre> <p>For the ASA 5505:</p> <pre>hostname(config)# <b>interface</b> <b>vlan</b> <i>number</i></pre> <p><b>Example:</b></p> <pre>hostname(config)# interface vlan 100</pre> | <p>If you are not already in interface configuration mode, enters interface configuration mode.</p> <p>The <b>redundant</b> <i>number</i> argument is the redundant interface ID, such as <b>redundant 1</b>.</p> <p>The <b>port-channel</b> <i>number</i> argument is the EtherChannel interface ID, such as <b>port-channel 1</b>.</p> <p>See the <a href="#">“Enabling the Physical Interface and Configuring Ethernet Parameters”</a> section for a description of the physical interface ID.</p> <p>Append the <i>subinterface</i> ID to the physical or redundant interface ID separated by a period (.).</p> <p>In multiple context mode, enter the <i>mapped_name</i> if one was assigned using the <b>allocate-interface</b> command.</p> |
| <b>Step 2</b> | <pre><b>mac-address</b> <i>mac_address</i><br/>[<b>standby</b> <i>mac_address</i>]</pre> <p><b>Example:</b></p> <pre>hostname(config-if)# mac-address<br/>000C.F142.4CDE</pre>                                                                                                                                                                                                                    | <p>Assigns a private MAC address to this interface. The <i>mac_address</i> is in H.H.H format, where H is a 16-bit hexadecimal digit. For example, the MAC address 00-0C-F1-42-4C-DE is entered as 000C.F142.4CDE.</p> <p>The first two bytes of a manual MAC address cannot be A2 if you also want to use auto-generated MAC addresses.</p> <p>For use with failover, set the <b>standby</b> MAC address. If the active unit fails over and the standby unit becomes active, the new active unit starts using the active MAC addresses to minimize network disruption, while the old active unit uses the standby address.</p>                                                                                                                    |
| <b>Step 3</b> | <pre><b>mtu</b> <i>interface_name</i> <i>bytes</i></pre> <p><b>Example:</b></p> <pre>hostname(config)# mtu inside 9200</pre>                                                                                                                                                                                                                                                                      | <p>Sets the MTU between 300 and 65,535 bytes. The default is 1500 bytes.</p> <p><b>Note</b> When you set the MTU for a redundant or port-channel interface, the ASA applies the setting to all member interfaces.</p> <p>For models that support jumbo frames, if you enter a value for any interface that is greater than 1500, then you need to enable jumbo frame support. See the <a href="#">“Enabling Jumbo Frame Support (Supported Models)”</a> section on page 6-31.</p>                                                                                                                                                                                                                                                                  |

## What to Do Next

(Optional) Configure IPv6 addressing. See the [“Configuring IPv6 Addressing”](#) section on page 9-13.

## Configuring IPv6 Addressing

This section describes how to configure IPv6 addressing. For more information about IPv6, see the [“Information About IPv6 Support”](#) section on page 21-9 and the [“IPv6 Addresses”](#) section on page B-5.

This section includes the following topics:

- [Information About IPv6, page 9-14](#)
- [Configuring a Global IPv6 Address and Other Options, page 9-15](#)

## Information About IPv6

This section includes information about how to configure IPv6, and includes the following topics:

- [IPv6 Addressing, page 9-14](#)
- [Duplicate Address Detection, page 9-14](#)
- [Modified EUI-64 Interface IDs, page 9-15](#)
- [Unsupported Commands, page 9-15](#)

### IPv6 Addressing

You can configure two types of unicast addresses for IPv6:

- **Global**—The global address is a public address that you can use on the public network. This address needs to be configured for each bridge group, and not per-interface. You can also configure a global IPv6 address for the management interface.
- **Link-local**—The link-local address is a private address that you can only use on the directly-connected network. Routers do not forward packets using link-local addresses; they are only for communication on a particular physical network segment. They can be used for address configuration or for the ND functions such as address resolution and neighbor discovery. Because the link-local address is only available on a segment, and is tied to the interface MAC address, you need to configure the link-local address per interface.

At a minimum, you need to configure a link-local address for IPv6 to operate. If you configure a global address, a link-local address is automatically configured on each interface, so you do not also need to specifically configure a link-local address. If you do not configure a global address, then you need to configure the link-local address, either automatically or manually.

#### Note

If you want to only configure the link-local addresses, see the **ipv6 enable** (to auto-configure) or **ipv6 address link-local** (to manually configure) command in the *Cisco ASA 5500 Series Command Reference*.

### Duplicate Address Detection

During the stateless autoconfiguration process, duplicate address detection (DAD) verifies the uniqueness of new unicast IPv6 addresses before the addresses are assigned to interfaces (the new addresses remain in a tentative state while duplicate address detection is performed). Duplicate address detection is performed first on the new link-local address. When the link local address is verified as unique, then duplicate address detection is performed all the other IPv6 unicast addresses on the interface.

Duplicate address detection is suspended on interfaces that are administratively down. While an interface is administratively down, the unicast IPv6 addresses assigned to the interface are set to a pending state. An interface returning to an administratively up state restarts duplicate address detection for all of the unicast IPv6 addresses on the interface.

When a duplicate address is identified, the state of the address is set to DUPLICATE, the address is not used, and the following error message is generated:

```
%ASA-4-325002: Duplicate address ipv6_address/MAC_address on interface
```

If the duplicate address is the link-local address of the interface, the processing of IPv6 packets is disabled on the interface. If the duplicate address is a global address, the address is not used. However, all configuration commands associated with the duplicate address remain as configured while the state of the address is set to DUPLICATE.

If the link-local address for an interface changes, duplicate address detection is performed on the new link-local address and all of the other IPv6 address associated with the interface are regenerated (duplicate address detection is performed only on the new link-local address).

The ASA uses neighbor solicitation messages to perform duplicate address detection. By default, the number of times an interface performs duplicate address detection is 1.

## Modified EUI-64 Interface IDs

RFC 3513: Internet Protocol Version 6 (IPv6) Addressing Architecture requires that the interface identifier portion of all unicast IPv6 addresses, except those that start with binary value 000, be 64 bits long and be constructed in Modified EUI-64 format. The ASA can enforce this requirement for hosts attached to the local link.

When this feature is enabled on an interface, the source addresses of IPv6 packets received on that interface are verified against the source MAC addresses to ensure that the interface identifiers use the Modified EUI-64 format. If the IPv6 packets do not use the Modified EUI-64 format for the interface identifier, the packets are dropped and the following system log message is generated:

```
%ASA-3-325003: EUI-64 source address check failed.
```

The address format verification is only performed when a flow is created. Packets from an existing flow are not checked. Additionally, the address verification can only be performed for hosts on the local link. Packets received from hosts behind a router will fail the address format verification, and be dropped, because their source MAC address will be the router MAC address and not the host MAC address.

## Unsupported Commands

The following IPv6 commands are not supported in transparent firewall mode, because they require router capabilities:

- **ipv6 address autoconfig**
- **ipv6 nd prefix**
- **ipv6 nd ra-interval**
- **ipv6 nd ra-lifetime**
- **ipv6 nd suppress-ra**

The **ipv6 local pool** VPN command is not supported, because transparent mode does not support VPN.

## Configuring a Global IPv6 Address and Other Options

To configure a global IPv6 address and other options for a bridge group or management interface, perform the following steps.

### Note

Configuring the global address automatically configures the link-local address, so you do not need to configure it separately.

## Restrictions

The ASA does not support IPv6 anycast addresses.

## Prerequisites

- Set up your interfaces depending on your model:
  - ASA 5510 and higher—[Chapter 6, “Starting Interface Configuration \(ASA 5510 and Higher\).”](#)
  - ASA 5505—[Chapter 7, “Starting Interface Configuration \(ASA 5505\).”](#)
- In multiple context mode, you can only configure context interfaces that you already assigned to the context in the system configuration according to the [“Configuring Multiple Contexts” section on page 5-14.](#)
- In multiple context mode, complete this procedure in the context execution space. To change from the system to a context configuration, enter the **changeto context name** command.

## Detailed Steps

|               | Command                                                                                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p>For the bridge group:</p> <pre>interface bvi bridge_group_id</pre> <p>For the management interface:</p> <pre>interface management_interface_id</pre> <p>Example:</p> <pre>hostname(config)# interface bvi 1</pre> | <p>If you are not already in interface configuration mode, enters interface configuration mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 2</b> | <pre>ipv6 address ipv6-prefix/prefix-length [standby ipv6-prefix]</pre> <p><b>Example:</b></p> <pre>hostname(config-if)# ipv6 address 2001:0DB8::BA98:0:3210/48</pre>                                                | <p>Assigns a global address to the interface. When you assign a global address, the link-local address is automatically created for the interface (for a bridge group, for each member interface).</p> <p><b>standby</b> specifies the interface address used by the secondary unit or failover group in a failover pair.</p> <p><b>Note</b> The <b>eui-64</b> keyword to use the Modified EUI-64 interface ID in the low order 64 bits of the address is not supported in transparent mode.</p> <p>See the <a href="#">“IPv6 Addresses” section on page B-5</a> for more information about IPv6 addressing.</p> |
| <b>Step 3</b> | <p>(Optional)</p> <pre>ipv6 nd suppress-ra</pre> <p><b>Example:</b></p> <pre>hostname(config-if)# ipv6 nd suppress-ra</pre>                                                                                          | <p>Suppresses Router Advertisement messages on an interface. By default, Router Advertisement messages are automatically sent in response to router solicitation messages. You may want to disable these messages on any interface for which you do not want the ASA to supply the IPv6 prefix (for example, the outside interface).</p>                                                                                                                                                                                                                                                                         |

|               | Command                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | (Optional)<br><code>ipv6 nd dad attempts value</code><br><br><b>Example:</b><br><code>hostname(config-if)# ipv6 nd dad attempts 3</code>  | Changes the number of duplicate address detection attempts. The <i>value</i> argument can be any value from 0 to 600. Setting the <i>value</i> argument to 0 disables duplicate address detection on the interface.<br><br>By default, the number of times an interface performs duplicate address detection is 1. See the <a href="#">“Duplicate Address Detection” section on page 9-14</a> for more information.                                                                                                                                                                                     |
| <b>Step 5</b> | (Optional)<br><code>ipv6 nd ns-interval value</code><br><br><b>Example:</b><br><code>hostname(config-if)# ipv6 nd ns-interval 2000</code> | Changes the neighbor solicitation message interval. When you configure an interface to send out more than one duplicate address detection attempt with the <b>ipv6 nd dad attempts</b> command, this command configures the interval at which the neighbor solicitation messages are sent out. By default, they are sent out once every 1000 milliseconds. The <i>value</i> argument can be from 1000 to 3600000 milliseconds.<br><br><b>Note</b> Changing this value changes it for all neighbor solicitation messages sent out on the interface, not just those used for duplicate address detection. |
| <b>Step 6</b> | (Optional)<br><code>ipv6 enforce-eui64 if_name</code><br><br><b>Example:</b><br><code>hostname(config)# ipv6 enforce-eui64 inside</code>  | Enforces the use of Modified EUI-64 format interface identifiers in IPv6 addresses on a local link.<br><br>The <i>if_name</i> argument is the name of the interface, as specified by the <b>nameif</b> command, on which you are enabling the address format enforcement.<br><br>See the <a href="#">“Modified EUI-64 Interface IDs” section on page 9-15</a> for more information.                                                                                                                                                                                                                     |

## Allowing Same Security Level Communication

By default, interfaces on the same security level cannot communicate with each other, and packets cannot enter and exit the same interface. This section describes how to enable inter-interface communication when interfaces are on the same security level.

### Information About Inter-Interface Communication

Allowing interfaces on the same security level to communicate with each other is useful if you want traffic to flow freely between all same security interfaces without access lists.

If you enable same security interface communication, you can still configure interfaces at different security levels as usual.

### Detailed Steps

| Command                                                   | Purpose                                                                                     |
|-----------------------------------------------------------|---------------------------------------------------------------------------------------------|
| <code>same-security-traffic permit inter-interface</code> | Enables interfaces on the same security level so that they can communicate with each other. |

# Monitoring Interfaces

To monitor interfaces, enter one of the following commands:

| Command                              | Purpose                                     |
|--------------------------------------|---------------------------------------------|
| <code>show interface</code>          | Displays interface statistics.              |
| <code>show interface ip brief</code> | Displays interface IP addresses and status. |
| <code>show bridge-group</code>       | Shows bridge group information.             |

## Configuration Examples for Interfaces in Transparent Mode

The following example includes two bridge groups of three interfaces each, plus a management-only interface:

```
interface gigabitethernet 0/0
 nameif inside
 security-level 100
 bridge-group 1
 no shutdown
interface gigabitethernet 0/1
 nameif outside
 security-level 0
 bridge-group 1
 no shutdown
interface gigabitethernet 0/2
 nameif dmz
 security-level 50
 bridge-group 1
 no shutdown
interface bvi 1
 ip address 10.1.3.1 255.255.255.0 standby 10.1.3.2

interface gigabitethernet 1/0
 nameif inside
 security-level 100
 bridge-group 2
 no shutdown
interface gigabitethernet 1/1
 nameif outside
 security-level 0
 bridge-group 2
 no shutdown
interface gigabitethernet 1/2
 nameif dmz
 security-level 50
 bridge-group 2
 no shutdown
interface bvi 2
 ip address 10.3.5.8 255.255.255.0 standby 10.3.5.9

interface management 0/0
 nameif mgmt
 security-level 100
 ip address 10.2.1.1 255.255.255.0 standby 10.2.1.2
 no shutdown
```

# Feature History for Interfaces in Transparent Mode

Table 9-1 lists each feature change and the platform release in which it was implemented.

**Table 9-1** Feature History for Interfaces in Transparent Mode

| Feature Name                                                    | Platform Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Increased VLANs                                                 | 7.0(5)            | Increased the following limits: <ul style="list-style-type: none"> <li>• ASA5510 Base license VLANs from 0 to 10.</li> <li>• ASA5510 Security Plus license VLANs from 10 to 25.</li> <li>• ASA5520 VLANs from 25 to 100.</li> <li>• ASA5540 VLANs from 100 to 200.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Increased VLANs                                                 | 7.2(2)            | <p>The maximum number of VLANs for the Security Plus license on the ASA 5505 was increased from 5 (3 fully functional; 1 failover; one restricted to a backup interface) to 20 fully functional interfaces. In addition, the number of trunk ports was increased from 1 to 8. Now there are 20 fully functional interfaces, you do not need to use the backup interface command to cripple a backup ISP interface; you can use a fully-functional interface for it. The backup interface command is still useful for an Easy VPN configuration.</p> <p>VLAN limits were also increased for the ASA 5510 (from 10 to 50 for the Base license, and from 25 to 100 for the Security Plus license), the ASA 5520 (from 100 to 150), the ASA 5550 (from 200 to 250).</p> |
| Gigabit Ethernet Support for the ASA 5510 Security Plus License | 7.2(3)            | The ASA 5510 now supports GE (Gigabit Ethernet) for port 0 and 1 with the Security Plus license. If you upgrade the license from Base to Security Plus, the capacity of the external Ethernet0/0 and Ethernet0/1 ports increases from the original FE (Fast Ethernet) (100 Mbps) to GE (1000 Mbps). The interface names will remain Ethernet 0/0 and Ethernet 0/1. Use the <b>speed</b> command to change the speed on the interface and use the <b>show interface</b> command to see what speed is currently configured for each interface.                                                                                                                                                                                                                        |
| Native VLAN support for the ASA 5505                            | 7.2(4)/8.0(4)     | <p>You can now include the native VLAN in an ASA 5505 trunk port.</p> <p>We introduced the following command: <b>switchport trunk native vlan</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 9-1** *Feature History for Interfaces in Transparent Mode (continued)*

| Feature Name                                                                             | Platform Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------------------------------------------------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Jumbo packet support for the ASA 5580                                                    | 8.1(1)            | <p>The Cisco ASA 5580 supports jumbo frames. A jumbo frame is an Ethernet packet larger than the standard maximum of 1518 bytes (including Layer 2 header and FCS), up to 9216 bytes. You can enable support for jumbo frames for all interfaces by increasing the amount of memory to process Ethernet frames. Assigning more memory for jumbo frames might limit the maximum use of other features, such as access lists.</p> <p>We introduced the following command: <b>jumbo-frame reservation</b>.</p> |
| Increased VLANs for the ASA 5580                                                         | 8.1(2)            | The number of VLANs supported on the ASA 5580 are increased from 100 to 250.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| IPv6 support for transparent mode                                                        | 8.2(1)            | IPv6 support was introduced for transparent firewall mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Support for Pause Frames for Flow Control on the ASA 5580 10-Gigabit Ethernet Interfaces | 8.2(2)            | <p>You can now enable pause (XOFF) frames for flow control.</p> <p>We introduced the following command: <b>flowcontrol</b>.</p>                                                                                                                                                                                                                                                                                                                                                                             |
| Bridge groups for transparent mode                                                       | 8.4(1)            | <p>If you do not want the overhead of security contexts, or want to maximize your use of security contexts, you can group interfaces together in a bridge group, and then configure multiple bridge groups, one for each network. Bridge group traffic is isolated from other bridge groups. You can configure up to eight bridge groups of four interfaces each in single mode or per context.</p> <p>We introduced the following commands: <b>interface bvi</b>, <b>show bridge-group</b>.</p>            |

## **PART 4**

### **Configuring Basic Settings**

# CHAPTER 10

## Configuring the Hostname, Domain Name, Passwords, and Other Basic Settings

This chapter describes how to configure basic settings on your ASA that are typically required for a functioning configuration. This chapter includes the following sections:

- [Configuring the Hostname, Domain Name, and Passwords, page 10-1](#)
- [Setting the Date and Time, page 10-3](#)
- [Configuring the Master Passphrase, page 10-6](#)
- [Configuring the DNS Server, page 10-11](#)

## Configuring the Hostname, Domain Name, and Passwords

This section describes how to change the device name and passwords, and includes the following topics:

- [Changing the Login Password, page 10-1](#)
- [Changing the Enable Password, page 10-2](#)
- [Setting the Hostname, page 10-2](#)
- [Setting the Domain Name, page 10-3](#)

## Changing the Login Password

To change the login password, enter the following command:

| Command                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>{<b>passwd</b>   <b>password</b>} <i>password</i></code> | <p>Changes the login password. The login password is used for Telnet and SSH connections. The default login password is “cisco.”</p> <p>You can enter <b>passwd</b> or <b>password</b>. The password is a case-sensitive password of up to 16 alphanumeric and special characters. You can use any character in the password except a question mark or a space.</p> <p>The password is saved in the configuration in encrypted form, so you cannot view the original password after you enter it. Use the <b>no password</b> command to restore the password to the default setting.</p> |

## Changing the Enable Password

To change the enable password, enter the following command:

| Command                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>enable password</b> <i>password</i><br><br><b>Example:</b><br><pre>hostname(config)# passwd Pa\$\$w0rd</pre> | <p>Changes the enable password, which lets you enter privileged EXEC mode. By default, the enable password is blank.</p> <p>The <i>password</i> argument is a case-sensitive password of up to 16 alphanumeric and special characters. You can use any character in the password except a question mark or a space.</p> <p>This command changes the password for the highest privilege level. If you configure local command authorization, you can set enable passwords for each privilege level from 0 to 15.</p> <p>The password is saved in the configuration in encrypted form, so you cannot view the original password after you enter it. Enter the <b>enable password</b> command without a password to set the password to the default, which is blank.</p> |

## Setting the Hostname

To set the hostname, enter the following command:

| Command                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>hostname</b> <i>name</i><br><br><b>Example:</b><br><pre>hostname(config)# hostname farscape farscape(config)#</pre> | <p>Specifies the hostname for the ASA or for a context.</p> <p>This name can be up to 63 characters. A hostname must start and end with a letter or digit, and have as interior characters only letters, digits, or a hyphen.</p> <p>When you set a hostname for the ASA, that name appears in the command line prompt. If you establish sessions to multiple devices, the hostname helps you keep track of where you enter commands. The default hostname depends on your platform.</p> <p>For multiple context mode, the hostname that you set in the system execution space appears in the command line prompt for all contexts. The hostname that you optionally set within a context does not appear in the command line, but can be used by the <b>banner</b> command <b>\$(hostname)</b> token.</p> |

## Setting the Domain Name

To set the domain name, enter the following command:

| Command                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>domain-name</b> <i>name</i>                               | Specifies the domain name for the ASA.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Example:</b><br>hostname(config)# domain-name example.com | The ASA appends the domain name as a suffix to unqualified names. For example, if you set the domain name to “example.com,” and specify a syslog server by the unqualified name of “jupiter,” then the ASA qualifies the name to “jupiter.example.com.”<br><br>The default domain name is default.domain.invalid.<br><br>For multiple context mode, you can set the domain name for each context, as well as within the system execution space. |

## Setting the Date and Time

This section includes the following topics:

- [Setting the Time Zone and Daylight Saving Time Date Range, page 10-3](#)
- [Setting the Date and Time Using an NTP Server, page 10-4](#)
- [Setting the Date and Time Manually, page 10-6](#)

## Setting the Time Zone and Daylight Saving Time Date Range

To change the time zone and daylight saving time date range, perform the following steps:

|               | Command                                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                               |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>clock timezone</b> <i>zone</i><br>[ <i>-</i> ] <i>hours</i> [ <i>minutes</i> ]                                                                                                                                                       | Sets the time zone. By default, the time zone is UTC and the daylight saving time date range is from 2:00 a.m. on the first Sunday in April to 2:00 a.m. on the last Sunday in October.                                                                                                                               |
|               | <b>Example:</b><br>hostname(config)# clock<br>timezone PST -8                                                                                                                                                                           | Where <i>zone</i> specifies the time zone as a string, for example, <b>PST</b> for Pacific Standard Time.<br><br>The [ <i>-</i> ] <i>hours</i> value sets the number of hours of offset from UTC. For example, PST is <b>-8</b> hours.<br><br>The <i>minutes</i> value sets the number of minutes of offset from UTC. |
| <b>Step 2</b> | To change the date range for daylight saving time from the default, enter one of the following commands. The default recurring date range is from 2:00 a.m. on the second Sunday in March to 2:00 a.m. on the first Sunday in November: |                                                                                                                                                                                                                                                                                                                       |

| Command                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>clock summer-time zone date</b> {day month   month day} year hh:mm {day month   month day} year hh:mm [offset] | <p>Sets the start and end dates for daylight saving time as a specific date in a specific year. If you use this command, you need to reset the dates every year.</p> <p>The <i>zone</i> value specifies the time zone as a string, for example, <b>PDT</b> for Pacific Daylight Time.</p> <p>The <i>day</i> value sets the day of the month, from 1 to 31. You can enter the day and month as <b>April 1</b> or as <b>1 April</b>, for example, depending on your standard date format.</p> <p>The <i>month</i> value sets the month as a string. You can enter the day and month as <b>April 1</b> or as <b>1 April</b>, depending on your standard date format.</p> <p>The <i>year</i> value sets the year using four digits, for example, <b>2004</b>. The year range is 1993 to 2035.</p> <p>The <i>hh:mm</i> value sets the hour and minutes in 24-hour time.</p> <p>The <i>offset</i> value sets the number of minutes to change the time for daylight saving time. By default, the value is 60 minutes.</p> |
| <b>clock summer-time zone recurring</b> [week weekday month hh:mm week weekday month hh:mm] [offset]              | <p>Specifies the start and end dates for daylight saving time, in the form of a day and time of the month, and not a specific date in a year.</p> <p>This command enables you to set a recurring date range that you do not need to change yearly.</p> <p>The <i>zone</i> value specifies the time zone as a string, for example, <b>PDT</b> for Pacific Daylight Time.</p> <p>The <i>week</i> value specifies the week of the month as an integer between 1 and 4 or as the words <b>first</b> or <b>last</b>. For example, if the day might fall in the partial fifth week, then specify <b>last</b>.</p> <p>The <i>weekday</i> value specifies the day of the week: <b>Monday, Tuesday, Wednesday</b>, and so on.</p> <p>The <i>month</i> value sets the month as a string.</p> <p>The <i>hh:mm</i> value sets the hour and minutes in 24-hour time.</p> <p>The <i>offset</i> value sets the number of minutes to change the time for daylight savings time. By default, the value is 60 minutes.</p>           |

## Setting the Date and Time Using an NTP Server

To obtain the date and time from an NTP server, perform the following steps.

### Detailed Steps

|        | Command                                                          | Purpose                                    |
|--------|------------------------------------------------------------------|--------------------------------------------|
| Step 1 | <b>ntp authenticate</b>                                          | Enables authentication with an NTP server. |
|        | <b>Example:</b><br><pre>hostname(config)# ntp authenticate</pre> |                                            |

|               |                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <p><b>ntp trusted-key</b> <i>key_id</i></p> <p><b>Example:</b><br/> hostname(config)# ntp<br/> trusted-key 1</p>                                                                                                          | <p>Specifies an authentication key ID to be a trusted key, which is required for authentication with an NTP server.</p> <p>The <i>key_id</i> argument is a value between 1 and 4294967295. You can enter multiple trusted keys for use with multiple servers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 3</b> | <p><b>ntp authentication-key</b> <i>key_id</i><br/> <b>md5</b> <i>key</i></p> <p><b>Example:</b><br/> hostname(config)# ntp<br/> authentication-key 1 md5<br/> aNiceKey</p>                                               | <p>Sets a key to authenticate with an NTP server.</p> <p>The <i>key_id</i> argument is the ID you set in <a href="#">Step 2</a> using the <b>ntp trusted-key</b> command, and the <i>key</i> argument is a string up to 32 characters long.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 4</b> | <p><b>ntp server</b> <i>ip_address</i> [<b>key</b><br/> <i>key_id</i>] [<b>source</b> <i>interface_name</i>]<br/> [<b>prefer</b>]</p> <p><b>Example:</b><br/> hostname(config)# ntp server<br/> 10.1.1.1 key 1 prefer</p> | <p>Identifies an NTP server.</p> <p>The <i>key_id</i> argument is the ID you set in <a href="#">Step 2</a> using the <b>ntp trusted-key</b> command.</p> <p>The <b>source</b> <i>interface_name</i> keyword-argument pair identifies the outgoing interface for NTP packets if you do not want to use the default interface in the routing table. Because the system does not include any interfaces in multiple context mode, specify an interface name defined in the admin context.</p> <p>The <b>prefer</b> keyword sets this NTP server as the preferred server if multiple servers have similar accuracy. NTP uses an algorithm to determine which server is the most accurate and synchronizes to that one. If servers are of similar accuracy, then the <b>prefer</b> keyword specifies which of those servers to use. However, if a server is significantly more accurate than the preferred one, the ASA uses the more accurate one. For example, the ASA uses a server of stratum 2 over a server of stratum 3 that is preferred.</p> <p>You can identify multiple servers; the ASA uses the most accurate server.</p> <p><b>Note</b> In multiple context mode, set the time in the system configuration only.</p> |

## Setting the Date and Time Manually

To set the date and time manually, perform the following steps.

### Detailed Steps

| Command                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>clock set</b> <i>hh:mm:ss {month day   day month} year</i><br><br><b>Example:</b><br>hostname# clock set 20:54:00 april 1 2004 | <p>Sets the date time manually.</p> <p>The <i>hh:mm:ss</i> argument sets the hour, minutes, and seconds in 24-hour time. For example, enter <b>20:54:00</b> for 8:54 pm.</p> <p>The <i>day</i> value sets the day of the month, from 1 to 31. You can enter the day and month as <b>april 1</b> or as <b>1 april</b>, for example, depending on your standard date format.</p> <p>The <i>month</i> value sets the month. Depending on your standard date format, you can enter the day and month as <b>april 1</b> or as <b>1 april</b>.</p> <p>The <i>year</i> value sets the year using four digits, for example, <b>2004</b>. The year range is from 1993 to 2035.</p> <p>The default time zone is UTC. If you change the time zone after you enter the <b>clock set</b> command using the <b>clock timezone</b> command, the time automatically adjusts to the new time zone.</p> <p>This command sets the time in the hardware chip, and does not save the time in the configuration file. This time endures reboots. Unlike the other <b>clock</b> commands, this command is a privileged EXEC command. To reset the clock, you need to set a new time with the <b>clock set</b> command.</p> |

## Configuring the Master Passphrase

This section describes how to configure the master passphrase and includes the following topics:

- [Information About the Master Passphrase, page 10-6](#)
- [Licensing Requirements for the Master Passphrase, page 10-7](#)
- [Guidelines and Limitations, page 10-7](#)
- [Adding or Changing the Master Passphrase, page 10-7](#)
- [Disabling the Master Passphrase, page 10-9](#)
- [Recovering the Master Passphrase, page 10-10](#)
- [Feature History for the Master Passphrase, page 10-11](#)

## Information About the Master Passphrase

The master passphrase feature allows you to securely store plain text passwords in encrypted format. The master passphrase provides a key that is used to universally encrypt or mask all passwords, without changing any functionality. Features that implement the master passphrase include the following:

- OSPF

- EIGRP
- VPN load balancing
- VPN (remote access and site-to-site)
- Failover
- AAA servers
- Logging
- Shared licenses

## Licensing Requirements for the Master Passphrase

| Model      | License Requirement |
|------------|---------------------|
| All models | Base License.       |

## Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

### Context Mode Guidelines

Supported in single and multiple context mode.

## Adding or Changing the Master Passphrase

This section describes how to add or change the master passphrase.

### Prerequisites

- If failover is enabled but no failover shared key is set, an error message appears if you change the master passphrase, informing you that you must enter a failover shared key to protect the master passphrase changes from being sent as plain text.
- This procedure will only be accepted in a secure session, for example by console, SSH, or ASDM via HTTPS.

To add or change the master passphrase, perform the following steps:

## Detailed Steps

|        | Command                                                                                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>key config-key password-encryption</b><br/>[<i>new_passphrase</i> [<i>old_passphrase</i>]]</p> <p><b>Example:</b><br/>hostname(config)# key config-key<br/>password-encryption<br/>Old key: bumblebee<br/>New key: haverford<br/>Confirm key: haverford</p> | <p>Sets the passphrase used for generating the encryption key. The passphrase must be between 8 and 128 characters long. All characters except a back space and double quotes are accepted for the passphrase.</p> <p>If you do not enter the new passphrase in the command, you are prompted for it.</p> <p>When you want to change the passphrase, you also have to enter the old passphrase.</p> <p>See the “<a href="#">Examples</a>” section on page 10-9 for examples of the interactive prompts.</p> <p><b>Note</b> Use the interactive prompts to enter passwords to avoid having the passwords logged in the command history buffer.</p> <p>Use the <b>no key config-key password-encrypt</b> command with caution, because it changes the encrypted passwords into plain text passwords. You can use the <b>no</b> form of this command when downgrading to a software version that does not support password encryption.</p> |
| Step 2 | <p><b>password encryption aes</b></p> <p><b>Example:</b><br/>hostname(config)# password encryption aes</p>                                                                                                                                                        | <p>Enables password encryption. As soon as password encryption is turned on and the master passphrase is available, all the user passwords will be encrypted. The running configuration will show the passwords in the encrypted format.</p> <p>If the passphrase is not configured at the time that password encryption is enabled, the command will succeed in anticipation that the passphrase will be available in the future.</p> <p>If you later disable password encryption using the <b>no password encryption aes</b> command, all existing encrypted passwords are left unchanged, and as long as the master passphrase exists, the encrypted passwords will be decrypted, as required by the application.</p>                                                                                                                                                                                                                |
| Step 3 | <p><b>write memory</b></p> <p><b>Example:</b><br/>hostname(config)# write memory</p>                                                                                                                                                                              | <p>Saves the runtime value of the master passphrase and the resulting configuration. If you do not enter this command, passwords in startup configuration may still be visible if they were not saved with encryption before.</p> <p>In addition, in multiple context mode the master passphrase is changed in the system context configuration. As a result, the passwords in all contexts will be affected. If the <b>write memory</b> command is not entered in the system context mode, but not in all user contexts, then the encrypted passwords in user contexts may be stale. Alternatively, use the <b>write memory all</b> command in the system context to save all configurations.</p>                                                                                                                                                                                                                                      |

## Examples

In the following configuration example, no previous key is present:

```
hostname (config)# key config-key password-encryption 12345678
```

In the following configuration example, a key already exists:

```
Hostname (config)# key config-key password-encryption 23456789
Old key: 12345678
hostname (config)#
```

In the following configuration example, you want to key in interactively, but a key already exists. The Old key, New key, and Confirm key prompts will appear on your screen if you enter the **key config-key password-encryption** command and press **Enter** to access interactive mode.

```
hostname (config)# key config-key password-encryption
Old key: 12345678
New key: 23456789
Confirm key: 23456789
```

In the following example, you want to key in interactively, but no key is present. The New key and Confirm key prompts will appear on your screen if you are in interactive mode.

```
hostname (config)# key config-key password-encryption
New key: 12345678
Confirm key: 12345678
```

## Disabling the Master Passphrase

Disabling the master passphrase reverts encrypted passwords into plain text passwords. Removing the passphrase might be useful if you downgrade to a previous software version that does not support encrypted passwords.

### Prerequisites

- You must know the current master passphrase to disable it. If you do not know the passphrase, see the [“Recovering the Master Passphrase”](#) section on page 10-10.
- This procedure will only be accepted in a secure session, that is, by Telnet, SSH, or ASDM via HTTPS.

## Detailed Steps

|        | Command                                                                                                                                                                                                                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>no key config-key password-encryption</b><br/>[old_passphrase]]</p> <p><b>Example:</b><br/>hostname(config)# no key config-key password-encryption</p> <p>Warning! You have chosen to revert the encrypted passwords to plain text. This operation will expose passwords in the configuration and therefore exercise caution while viewing, storing, and copying configuration.</p> <p>Old key: bumblebee</p> | <p>Removes the master passphrase.</p> <p>If you do not enter the passphrase in the command, you are prompted for it.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 2 | <p><b>write memory</b></p> <p><b>Example:</b><br/>hostname(config)# write memory</p>                                                                                                                                                                                                                                                                                                                                | <p>Saves the run time value of the master passphrase and the resulting configuration. The non-volatile memory containing the passphrase will be erased and overwritten with the 0xFF pattern.</p> <p>In multiple mode the master passphrase is changed in the system context configuration. As a result the passwords in all contexts will be affected. If the <b>write memory</b> command is not entered in the system context mode, but not in all user contexts, then the encrypted passwords in user contexts may be stale. Alternatively, use the <b>write memory all</b> command in the system context to save all configurations.</p> |

## Recovering the Master Passphrase

You cannot recover the master passphrase.

If the master passphrase is lost or unknown, you can remove it using the **write erase** command followed by the **reload** command. These commands remove the master key and the configuration that includes the encrypted passwords.

## Feature History for the Master Passphrase

Table 10-1 lists each feature change and the platform release in which it was implemented.

**Table 10-1** Feature History for the Master Passphrase

| Feature Name                   | Platform Releases | Feature Information                                                                                                                                                                                                                                                                            |
|--------------------------------|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Master Passphrase              | 8.3(1)            | This feature was introduced.<br><br>We introduced the following commands: <b>key config-key password-encryption</b> , <b>password encryption aes</b> , <b>clear configure password encryption aes</b> , <b>show running-config password encryption aes</b> , <b>show password encryption</b> . |
| Password Encryption Visibility | 8.4(1)            | We modified the <b>show password encryption</b> command.                                                                                                                                                                                                                                       |

## Configuring the DNS Server

Some ASA features require use of a DNS server to access external servers by domain name; for example, the Botnet Traffic Filter feature requires a DNS server to access the dynamic database server and to resolve entries in the static database. Other features, such as the **ping** or **traceroute** command, let you enter a name that you want to ping or traceroute, and the ASA can resolve the name by communicating with a DNS server. Many SSL VPN and certificate commands also support names.

### Note

The ASA has limited support for using the DNS server, depending on the feature. For example, most commands require you to enter an IP address and can only use a name when you manually configure the **name** command to associate a name with an IP address and enable use of the names using the **names** command.

For information about dynamic DNS, see the “[Configuring DDNS](#)” section on page 12-2.

### Prerequisites

Make sure that you configure the appropriate routing for any interface on which you enable DNS domain lookup so you can reach the DNS server. See the “[Information About Routing](#)” section on page 21-1 for more information about routing.

### Detailed Steps

|        | Command                                                                                                                | Purpose                                                                                               |
|--------|------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| Step 1 | <b>dns domain-lookup</b> <i>interface_name</i><br><br><b>Example:</b><br>hostname(config)# dns domain-lookup<br>inside | Enables the ASA to send DNS requests to a DNS server to perform a name lookup for supported commands. |

|        |                                                                                                                                                                              |                                                                                                                                                                                                                                                                 |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 2 | <b>dns server-group DefaultDNS</b><br><br><b>Example:</b><br>hostname(config)# dns server-group DefaultDNS                                                                   | Specifies the DNS server group that the ASA uses for outgoing requests.<br><br>Other DNS server groups can be configured for VPN tunnel groups. See the <b>tunnel-group</b> command in the <i>Cisco ASA 5500 Series Command Reference</i> for more information. |
| Step 3 | <b>name-server ip_address [ip_address2] [...]</b> [ip_address6]<br><br><b>Example:</b><br>hostname(config-dns-server-group)# name-server 10.1.1.5 192.168.1.67 209.165.201.6 | Specifies one or more DNS servers. You can enter all six IP addresses in the same command, separated by spaces, or you can enter each command separately. The ASA tries each DNS server in order until it receives a response.                                  |

## Monitoring DNS Cache

The ASA provides a local cache of DNS information from external DNS queries that are sent for certain clientless SSL VPN and certificate commands. Each DNS translation request is first looked for in the local cache. If the local cache has the information, the resulting IP address is returned. If the local cache can not resolve the request, a DNS query is sent to the various DNS servers that have been configured. If an external DNS server resolves the request, the resulting IP address is stored in the local cache with its corresponding hostname.

## DNS Cache Monitoring Commands

To monitor the DNS cache, enter the following command:

| Command               | Purpose                                                                                                                                                           |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show dns-hosts</b> | Show the DNS cache, which includes dynamically learned entries from a DNS server as well as manually entered name and IP addresses using the <b>name</b> command. |

## Feature History for DNS Cache

Table 2 lists each feature change and the platform release in which it was implemented.

**Table 2** Feature History for DNS Cache

| Feature Name | Platform Releases | Feature Information                                                                      |
|--------------|-------------------|------------------------------------------------------------------------------------------|
| DNS Cache    | 7.0(1)            | DNS cache stores responses which allows a DNS server to respond more quickly to queries. |

# CHAPTER 11

## Configuring DHCP

This chapter describes how to configure the DHCP server, and includes the following sections:

- [Information About DHCP, page 11-1](#)
- [Licensing Requirements for DHCP, page 11-1](#)
- [Guidelines and Limitations, page 11-2](#)
- [Configuring a DHCP Server, page 11-2](#)
- [Configuring DHCP Relay Services, page 11-7](#)
- [DHCP Monitoring Commands, page 11-8](#)
- [Feature History for DHCP, page 11-8](#)

## Information About DHCP

DHCP provides network configuration parameters, such as IP addresses, to DHCP clients. The ASA can provide a DHCP server or DHCP relay services to DHCP clients attached to ASA interfaces. The DHCP server provides network configuration parameters directly to DHCP clients. DHCP relay passes DHCP requests received on one interface to an external DHCP server located behind a different interface.

## Licensing Requirements for DHCP

[Table 11-1](#) shows the licensing requirements for DHCP.

**Table 11-1**     *Licensing Requirements*

| Model      | License Requirement |
|------------|---------------------|
| All models | Base License.       |

For the Cisco ASA 5505, the maximum number of DHCP client addresses varies depending on the license:

- If the limit is 10 hosts, the maximum available DHCP pool is 32 addresses.
- If the limit is 50 hosts, the maximum available DHCP pool is 128 addresses.
- If the number of hosts is unlimited, the maximum available DHCP pool is 256 addresses.

**Note**

By default, the Cisco ASA 5505 ships with a 10-user license.

## Guidelines and Limitations

Use the following guidelines to configure the DHCP server:

- You can configure a DHCP server on each interface of the ASA. Each interface can have its own pool of addresses to draw from. However the other DHCP settings, such as DNS servers, domain name, options, ping timeout, and WINS servers, are configured globally and used by the DHCP server on all interfaces.
- You cannot configure a DHCP client or DHCP relay services on an interface on which the server is enabled. Additionally, DHCP clients must be directly connected to the interface on which the server is enabled.
- The ASA does not support QIP DHCP servers for use with DHCP proxy.
- The relay agent cannot be enabled if the DHCP server is also enabled.
- When it receives a DHCP request, the ASA sends a discovery message to the DHCP server. This message includes the IP address (within a subnetwork) configured with the **dhcp-network-scope** command in the group policy. If the server has an address pool that falls within that subnetwork, the server sends the offer message with the pool information to the IP address—not to the source IP address of the discovery message.
- For example, if the server has a pool in the range of 209.165.200.225 to 209.165.200.254, mask 255.255.255.0, and the IP address specified by the **dhcp-network-scope** command is 209.165.200.1, the server sends that pool in the offer message to the ASA.

### Failover Guidelines

Supports Active/Active and Active/Standby failover.

### Firewall Mode Guidelines

Supported in routed and transparent firewall modes.

### Context Mode Guidelines

Supported in single mode and multiple context mode.

## Configuring a DHCP Server

This section describes how to configure a DHCP server provided by the ASA, and includes the following topics:

- [Enabling the DHCP Server, page 11-3](#)
- [Configuring DHCP Options, page 11-4](#)
- [Using Cisco IP Phones with a DHCP Server, page 11-6](#)
- [DHCP Monitoring Commands, page 11-8](#)

## Enabling the DHCP Server

The ASA can act as a DHCP server. DHCP is a protocol that provides network settings to hosts, including the host IP address, the default gateway, and a DNS server.

**Note**

The ASA DHCP server does not support BOOTP requests. In multiple context mode, you cannot enable the DHCP server or DHCP relay on an interface that is used by more than one context.

To enable the DHCP server on a ASA interface, perform the following steps:

|               | Command                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>dhcpgd address</b> <i>ip_address-ip_address</i><br><i>interface_name</i><br><br><b>Example:</b><br>hostname(config)# dhcpgd address<br>10.0.1.101-10.0.1.110 inside | Create a DHCP address pool. The ASA assigns a client one of the addresses from this pool to use for a given length of time. These addresses are the local, untranslated addresses for the directly connected network.<br><br>The address pool must be on the same subnet as the ASA interface. |
| <b>Step 2</b> | <b>dhcpgd dns</b> <i>dns1</i> [ <i>dns2</i> ]<br><br><b>Example:</b><br>hostname(config)# dhcpgd dns 209.165.201.2<br>209.165.202.129                                  | (Optional) Specifies the IP address(es) of the DNS server(s).                                                                                                                                                                                                                                  |
| <b>Step 3</b> | <b>dhcpgd wins</b> <i>wins1</i> [ <i>wins2</i> ]<br><br><b>Example:</b><br>hostname(config)# dhcpgd wins 209.165.201.5                                                 | (Optional) Specifies the IP address(es) of the WINS server(s). You can specify up to two WINS servers.                                                                                                                                                                                         |
| <b>Step 4</b> | <b>dhcpgd lease</b> <i>lease_length</i><br><br><b>Example:</b><br>hostname(config)# dhcpgd lease 3000                                                                  | (Optional) Change the lease length to be granted to the client. This lease equals the amount of time (in seconds) the client can use its allocated IP address before the lease expires. Enter a value between 0 to 1,048,575. The default value is 3600 seconds.                               |
| <b>Step 5</b> | <b>dhcpgd domain</b> <i>domain_name</i><br><br><b>Example:</b><br>hostname(config)# dhcpgd domain example.com                                                          | (Optional) Configures the domain name.                                                                                                                                                                                                                                                         |
| <b>Step 6</b> | <b>dhcpgd ping_timeout</b> <i>milliseconds</i><br><br><b>Example:</b><br>hostname(config)# dhcpgd ping timeout 20                                                      | (Optional) Configures the DHCP ping timeout value. To avoid address conflicts, the ASA sends two ICMP ping packets to an address before assigning that address to a DHCP client. This command specifies the timeout value for those packets.                                                   |

|               | Command                                                                                                              | Purpose                                                                                                                                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 7</b> | <b>dhcpcd option 3 ip</b> <i>gateway_ip</i><br><br><b>Example:</b><br>hostname(config)# dhcpcd option 3 ip 10.10.1.1 | (Transparent Firewall Mode) Defines a default gateway that is sent to DHCP clients. If you do not use the DHCP option 3 to define the default gateway, DHCP clients use the IP address of the management interface. The management interface does not route traffic. |
| <b>Step 8</b> | <b>dhcpcd enable</b> <i>interface_name</i><br><br><b>Example:</b><br>hostname(config)# dhcpcd enable outside         | Enables the DHCP daemon within the ASA to listen for DHCP client requests on the enabled interface.                                                                                                                                                                  |

## Configuring DHCP Options

You can configure the ASA to send information for the DHCP options listed in RFC 2132. The DHCP options include the following three categories:

- [Options that Return an IP Address, page 11-4](#)
- [Options that Return a Text String, page 11-4](#)
- [Options that Return a Hexadecimal Value, page 11-5](#)

The ASA supports all three categories. To configure a DHCP option, choose one of the following commands:

### Options that Return an IP Address

| Command                                                                                                                                                       | Purpose                                                        |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>dhcpcd option</b> <i>code</i> <b>ip</b> <i>addr_1</i> [ <i>addr_2</i> ]<br><br><b>Example:</b><br>hostname(config)# dhcpcd option 2 ip 10.10.1.1 10.10.1.2 | Configures a DHCP option that returns one or two IP addresses. |

### Options that Return a Text String

| Command                                                                                                                                   | Purpose                                              |
|-------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
| <b>dhcpcd option</b> <i>code</i> <b>ascii</b> <i>text</i><br><br><b>Example:</b><br>hostname(config)# dhcpcd option 2 ascii examplestring | Configures a DHCP option that returns a text string. |

## Options that Return a Hexadecimal Value

| Command                                                                                                                | Purpose                                                    |
|------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
| <b>dhcpd option</b> <i>code hex value</i>                                                                              | Configures a DHCP option that returns a hexadecimal value. |
| <b>Example:</b><br><pre>hostname(config)# dhcpd option 2 hex 22.0011.01.FF1111.00FF.0000.AAAA.1111.1111 .1111.11</pre> |                                                            |

### Note

The ASA does not verify that the option type and value that you provide match the expected type and value for the option code as defined in RFC 2132. For example, you can enter the `dhcpd option 46 ascii hello` command, and the ASA accepts the configuration, although option 46 is defined in RFC 2132 to expect a single-digit, hexadecimal value. For more information about the option codes and their associated types and expected values, see RFC 2132.

Table 11-2 shows the DHCP options that are not supported by the **dhcpd option** command.

**Table 11-2**      *Unsupported DHCP Options*

| Option Code | Description               |
|-------------|---------------------------|
| 0           | DHCPOPT_PAD               |
| 1           | HCPOPT_SUBNET_MASK        |
| 12          | DHCPOPT_HOST_NAME         |
| 50          | DHCPOPT_REQUESTED_ADDRESS |
| 51          | DHCPOPT_LEASE_TIME        |
| 52          | DHCPOPT_OPTION_OVERLOAD   |
| 53          | DHCPOPT_MESSAGE_TYPE      |
| 54          | DHCPOPT_SERVER_IDENTIFIER |
| 58          | DHCPOPT_RENEWAL_TIME      |
| 59          | DHCPOPT_REBINDING_TIME    |
| 61          | DHCPOPT_CLIENT_IDENTIFIER |
| 67          | DHCPOPT_BOOT_FILE_NAME    |
| 82          | DHCPOPT_RELAY_INFORMATION |
| 255         | DHCPOPT_END               |

DHCP options 3, 66, and 150 are used to configure Cisco IP Phones. For more information about configuring these options, see the [“Using Cisco IP Phones with a DHCP Server”](#) section on page 11-6.

## Using Cisco IP Phones with a DHCP Server

Enterprises with small branch offices that implement a Cisco IP Telephony Voice over IP solution typically implement Cisco CallManager at a central office to control Cisco IP Phones at small branch offices. This implementation allows centralized call processing, reduces the equipment required, and eliminates the administration of additional Cisco CallManager and other servers at branch offices.

Cisco IP Phones download their configuration from a TFTP server. When a Cisco IP Phone starts, if it does not have both the IP address and TFTP server IP address preconfigured, it sends a request with option 150 or 66 to the DHCP server to obtain this information.

- DHCP option 150 provides the IP addresses of a list of TFTP servers.
- DHCP option 66 gives the IP address or the hostname of a single TFTP server.

### Note

Cisco IP Phones might also include DHCP option 3 in their requests, which sets the default route.

A single request might include both options 150 and 66. In this case, the ASA DHCP server provides values for both options in the response if they are already configured on the ASA.

You can configure the ASA to send information for most options listed in RFC 2132. The following examples show the syntax for any option number, as well as the syntax for options 3, 66, and 150:

| Command                                              | Purpose                                                                                        |
|------------------------------------------------------|------------------------------------------------------------------------------------------------|
| <b>dhcpcd option</b> <i>number value</i>             | Provides information for DHCP requests that include an option number as specified in RFC-2132. |
| <b>Example:</b><br>hostname(config)# dhcpcd option 2 |                                                                                                |

| Command                                                                      | Purpose                                                         |
|------------------------------------------------------------------------------|-----------------------------------------------------------------|
| <b>dhcpcd option 66 ascii</b> <i>server_name</i>                             | Provides the IP address or name of a TFTP server for option 66. |
| <b>Example:</b><br>hostname(config)# dhcpcd option 66 ascii<br>exampleserver |                                                                 |

| Command                                                                | Purpose                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dhcpcd option 150 ip</b> <i>server_ip1</i><br>[ <i>server_ip2</i> ] | Provides the IP address or names of one or two TFTP servers for option 150. The <i>server_ip1</i> is the IP address or name of the primary TFTP server while <i>server_ip2</i> is the IP address or name of the secondary TFTP server. A maximum of two TFTP servers can be identified using option 150. |
| <b>Example:</b><br>hostname(config)# dhcpcd option 150 ip<br>10.10.1.1 |                                                                                                                                                                                                                                                                                                          |

| Command                                                                      | Purpose                 |
|------------------------------------------------------------------------------|-------------------------|
| <b>dhcpcd option 3 ip</b> <i>router_ip1</i>                                  | Sets the default route. |
| <b>Example:</b><br><pre>hostname(config)# dhcpcd option 3 ip 10.10.1.1</pre> |                         |

## Configuring DHCP Relay Services

A DHCP relay agent allows the ASA to forward DHCP requests from clients to a router connected to a different interface.

The following restrictions apply to the use of the DHCP relay agent:

- The relay agent cannot be enabled if the DHCP server feature is also enabled.
- DHCP clients must be directly connected to the ASA and cannot send requests through another relay agent or a router.
- For multiple context mode, you cannot enable DHCP relay on an interface that is used by more than one context.
- DHCP Relay services are not available in transparent firewall mode. An ASA in transparent firewall mode only allows ARP traffic through; all other traffic requires an access list. To allow DHCP requests and replies through the ASA in transparent mode, you need to configure two access lists, one that allows DHCP requests from the inside interface to the outside, and one that allows the replies from the server in the other direction.
- When DHCP relay is enabled and more than one DHCP relay server is defined, the ASA forwards client requests to each defined DHCP relay server. Replies from the servers are also forwarded to the client until the client DHCP relay binding is removed. The binding is removed when the ASA receives any of the following DHCP messages: ACK, NACK, or decline.

### Note

You cannot enable DHCP Relay on an interface running DHCP Proxy. You must Remove VPN DHCP configuration first or you will see an error message. This error happens if both DHCP relay and DHCP proxy are enabled. Ensure that either DHCP relay or DHCP proxy are enabled, but not both.

To enable DHCP relay, perform the following steps:

|               | Command                                                                        | Purpose                                                                            |
|---------------|--------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>dhcprelay server</b> <i>ip_address if_name</i>                              | Set the IP address of a DHCP server on a different interface from the DHCP client. |
|               | <b>Example:</b><br><pre>hostname(config)# dhcprelay server 201.168.200.4</pre> | You can use this command up to ten times to identify up to ten servers.            |
| <b>Step 2</b> | <b>dhcprelay enable</b> <i>interface</i>                                       | Enables DHCP relay on the interface connected to the clients.                      |
|               | <b>Example:</b><br><pre>hostname(config)# dhcprelay enable inside</pre>        |                                                                                    |

|        | Command                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                               |
|--------|-----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <b>dhcprelay timeout</b> <i>seconds</i><br><br><b>Example:</b><br>hostname(config)# dhcprelay timeout 25              | (Optional) Set the number of seconds allowed for relay address negotiation.                                                                                                                                                                                                                                                                                                           |
| Step 4 | <b>dhcprelay setroute</b> <i>interface_name</i><br><br><b>Example:</b><br>hostname(config)# dhcprelay setroute inside | (Optional) Change the first default router address in the packet sent from the DHCP server to the address of the ASA interface.<br><br>This action allows the client to set its default route to point to the ASA even if the DHCP server specifies a different router.<br><br>If there is no default router option in the packet, the ASA adds one containing the interface address. |

## DHCP Monitoring Commands

To monitor DHCP, enter one of the following commands:

| Command                              | Purpose                                       |
|--------------------------------------|-----------------------------------------------|
| <b>show running-config dhcpd</b>     | Shows the current DHCP configuration.         |
| <b>show running-config dhcprelay</b> | Shows the current DHCP relay services status. |

## Feature History for DHCP

Table 11-3 lists the release history for this feature.

**Table 11-3** Feature History for DHCP

| Feature Name | Releases | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

# CHAPTER 12

## Configuring Dynamic DNS

---

This chapter describes how to configure DDNS update methods, and includes the following topics:

- [Information about DDNS, page 12-1](#)
- [Licensing Requirements for DDNS, page 12-2](#)
- [Guidelines and Limitations, page 12-2](#)
- [Configuring DDNS, page 12-2](#)
- [Configuration Examples for DDNS, page 12-3](#)
- [DDNS Monitoring Commands, page 12-6](#)
- [Feature History for DDNS, page 12-6](#)

### Information about DDNS

DDNS update integrates DNS with DHCP. The two protocols are complementary: DHCP centralizes and automates IP address allocation; DDNS update automatically records the association between assigned addresses and hostnames at pre-defined intervals. DDNS allows frequently changing address-hostname associations to be updated frequently. Mobile hosts, for example, can then move freely on a network without user or administrator intervention. DDNS provides the necessary dynamic update and synchronization of the name-to-address mapping and address-to-name mapping on the DNS server. To configure the DNS server for other uses, see the [“Configuring the DNS Server” section on page 10-11](#). To configure DHCP, see the [“Configuring a DHCP Server” section on page 11-2](#).

EDNS allows DNS requesters to advertise the size of their UDP packets and facilitates the transfer of packets larger than 512 octets. When a DNS server receives a request over UDP, it identifies the size of the UDP packet from the OPT resource record (RR) and scales its response to contain as many resource records as are allowed in the maximum UDP packet size specified by the requester. The size of the DNS packets can be up to 4096 bytes for BIND or 1280 bytes for the Windows 2003 DNS Server. Several additional **message-length maximum** commands are available:

- The existing global limit: **message-length maximum 512**
- A client or server specific limit: **message-length maximum client 4096**
- The dynamic value specified in the OPT RR field: **message-length maximum client auto**

If the three commands are present at the same time, the ASA enforces the minimum of the three specified values.

# Licensing Requirements for DDNS

The following table shows the licensing requirements for DDNS:

| Model      | License Requirement |
|------------|---------------------|
| All models | Base License.       |

## Guidelines and Limitations

### Failover Guidelines

Supports Active/Active and Active/Standby failover.

### Firewall Mode Guidelines

Supported in routed firewall mode.

### Context Mode Guidelines

Supported in single and multiple context modes.

Supported in transparent mode for the DNS Client pane.

### IPv6 Guidelines

Supports IPv6.

## Configuring DDNS

This section describes examples for configuring the ASA to support Dynamic DNS. DDNS update integrates DNS with DHCP. The two protocols are complementary—DHCP centralizes and automates IP address allocation, while dynamic DNS update automatically records the association between assigned addresses and hostnames. When you use DHCP and dynamic DNS update, this configures a host automatically for network access whenever it attaches to the IP network. You can locate and reach the host using its permanent, unique DNS hostname. Mobile hosts, for example, can move freely without user or administrator intervention.

DDNS provides address and domain name mapping so that hosts can find each other, even though their DHCP-assigned IP addresses change frequently. The DDNS name and address mapping is held on the DHCP server in two resource records: the A RR includes the name-to IP address mapping, while the PTR RR maps addresses to names. Of the two methods for performing DDNS updates—the IETF standard defined by RFC 2136 and a generic HTTP method—the ASA supports the IETF method in this release.

The two most common DDNS update configurations are the following:

- The DHCP client updates the A RR, while the DHCP server updates the PTR RR.
- The DHCP server updates both the A RR and PTR RR.

In general, the DHCP server maintains DNS PTR RRs on behalf of clients. Clients may be configured to perform all desired DNS updates. The server may be configured to honor these updates or not. To update the PTR RR, the DHCP server must know the FQDN of the client. The client provides an FQDN to the server using a DHCP option called Client FQDN.

## Configuration Examples for DDNS

The following examples present five common scenarios:

- [Example 1: Client Updates Both A and PTR RRs for Static IP Addresses, page 12-3](#)
- [Example 2: Client Updates Both A and PTR RRs; DHCP Server Honors Client Update Request; FQDN Provided Through Configuration, page 12-3](#)
- [Example 3: Client Includes FQDN Option Instructing Server Not to Update Either RR; Server Overrides Client and Updates Both RRs., page 12-4](#)
- [Example 4: Client Asks Server To Perform Both Updates; Server Configured to Update PTR RR Only; Honors Client Request and Updates Both A and PTR RR, page 12-5](#)
- [Example 5: Client Updates A RR; Server Updates PTR RR, page 12-5](#)

### Example 1: Client Updates Both A and PTR RRs for Static IP Addresses

The following example shows how to configure the client to request that it update both A and PTR resource records for static IP addresses.

To configure this scenario, perform the following steps:

- 
- Step 1** To define a DDNS update method called `ddns-2` that requests that the client update both the A RR and PTR RR, enter the following commands:
- ```
hostname(config)# ddns update method ddns-2
hostname(DDNS-update-method)# ddns both
```
- Step 2** To associate the method `ddns-2` with the `eth1` interface, enter the following commands:
- ```
hostname(DDNS-update-method)# interface eth1
hostname(config-if)# ddns update ddns-2
hostname(config-if)# ddns update hostname asa.example.com
```
- Step 3** To configure a static IP address for `eth1`, enter the following command:
- ```
hostname(config-if)# ip address 10.0.0.40 255.255.255.0
```
-

Example 2: Client Updates Both A and PTR RRs; DHCP Server Honors Client Update Request; FQDN Provided Through Configuration

The following example shows how to configure the DHCP client to request that it update both the A and PTR RRs, and the DHCP server to honor these requests.

To configure this scenario, perform the following steps:

-
- Step 1** To configure the DHCP client to request that the DHCP server perform no updates, enter the following command:
- ```
hostname(config)# dhcp-client update dns server none
```
- Step 2** To create a DDNS update method named ddns-2 on the DHCP client that requests that the client perform both A and PTR updates, enter the following commands:
- ```
hostname(config)# ddns update method ddns-2
hostname(DDNS-update-method)# ddns both
```
- Step 3** To associate the method named ddns-2 with the ASA interface named Ethernet0, and enable DHCP on the interface, enter the following commands:
- ```
hostname(DDNS-update-method)# interface Ethernet0
hostname(if-config)# ddns update ddns-2
hostname(if-config)# ddns update hostname asa.example.com
hostname(if-config)# ip address dhcp
```
- Step 4** To configure the DHCP server, enter the following command:
- ```
hostname(if-config)# dhcpd update dns
```
-

Example 3: Client Includes FQDN Option Instructing Server Not to Update Either RR; Server Overrides Client and Updates Both RRs.

The following example shows how to configure the DHCP client to include the FQDN option that instruct the DHCP server not to honor either the A or PTR updates. The example also shows how to configure the server to override the client request. As a result, the client does not perform any updates.

To configure this scenario, perform the following steps:

-
- Step 1** To configure the update method named ddns-2 to request that it make both A and PTR RR updates, enter the following commands:
- ```
hostname(config)# ddns update method ddns-2
hostname(DDNS-update-method)# ddns both
```
- Step 2** To assign the DDNS update method named ddns-2 on interface Ethernet0 and provide the client hostname (asa), enter the following commands:
- ```
hostname(DDNS-update-method)# interface Ethernet0
hostname(if-config)# ddns update ddns-2
hostname(if-config)# ddns update hostname asa.example.com
```
- Step 3** To enable the DHCP client feature on the interface, enter the following commands:
- ```
hostname(if-config)# dhcp client update dns server none
hostname(if-config)# ip address dhcp
```
- Step 4** To configure the DHCP server to override the client update requests, enter the following command:
- ```
hostname(if-config)# dhcpd update dns both override
```
-

Example 4: Client Asks Server To Perform Both Updates; Server Configured to Update PTR RR Only; Honors Client Request and Updates Both A and PTR RR

The following example shows how to configure the server to perform only PTR RR updates by default. However, the server honors the client request that it perform both A and PTR updates. The server also forms the FQDN by appending the domain name (example.com) to the hostname that the client (asa) has provided.

To configure this scenario, perform the following steps:

- Step 1** To configure the DHCP client on interface Ethernet0, enter the following commands:

```
hostname(config)# interface Ethernet0
hostname(config-if)# dhcp client update dns both
hostname(config-if)# ddns update hostname asa
```

- Step 2** To configure the DHCP server, enter the following commands:

```
hostname(config-if)# dhcpd update dns
hostname(config-if)# dhcpd domain example.com
```

Example 5: Client Updates A RR; Server Updates PTR RR

The following example shows how to configure the client to update the A resource record and how to configure the server to update the PTR records. Also, the client uses the domain name from the DHCP server to form the FQDN.

To configure this scenario, perform the following steps:

- Step 1** To define the DDNS update method named ddns-2, enter the following commands:

```
hostname(config)# ddns update method ddns-2
hostname(DDNS-update-method)# ddns
```

- Step 2** To configure the DHCP client for interface Ethernet0 and assign the update method to the interface, enter the following commands:

```
hostname(DDNS-update-method)# interface Ethernet0
hostname(config-if)# dhcp client update dns
hostname(config-if)# ddns update ddns-2
hostname(config-if)# ddns update hostname asa
```

- Step 3** To configure the DHCP server, enter the following commands:

```
hostname(config-if)# dhcpd update dns
hostname(config-if)# dhcpd domain example.com
```

DDNS Monitoring Commands

To monitor DDNS, enter one of the following commands:

Command	Purpose
<code>show running-config ddns</code>	Shows the current DDNS configuration.
<code>show running-config dns server-group</code>	Shows the current DNS server group status.

Feature History for DDNS

[Table 12-1](#) lists the release history for this feature.

Table 12-1 *Feature History for DDNS*

Feature Name	Releases	Feature Information
DDNS	7.0(1)	This feature was introduced. The following commands were introduced: ddns , ddns update , dhcp client update dns , dhcpd update dns , show running-config ddns , and show running-config dns server-group .

PART 5

Configuring Objects and Access Lists

CHAPTER 13

Configuring Objects

Objects are reusable components for use in your configuration. They can be defined and used in ASA configurations in the place of inline IP addresses. Objects make it easy to maintain your configurations because you can modify an object in one place and have it be reflected in all other places that are referencing it. Without objects you would have to modify the parameters for every feature when required, instead of just once. For example, if a network object defines an IP address and subnet mask, and you want to change the address, you only need to change it in the object definition, not in every feature that refers to that IP address.

This chapter describes how to configure objects, and it includes the following sections:

- [Configuring Objects and Groups, page 13-1](#)
- [Configuring Regular Expressions, page 13-12](#)
- [Scheduling Extended Access List Activation, page 13-16](#)

Configuring Objects and Groups

This section includes the following topics:

- [Information About Objects and Groups, page 13-1](#)
- [Licensing Requirements for Objects and Groups, page 13-2](#)
- [Guidelines and Limitations for Objects and Groups, page 13-3](#)
- [Configuring Objects, page 13-3](#)
- [Configuring Object Groups, page 13-6](#)
- [Monitoring Objects and Groups, page 13-11](#)
- [Feature History for Objects and Groups, page 13-12](#)

Information About Objects and Groups

The ASA supports objects and object groups. You can attach or detach objects from one or more object groups when needed, ensuring that the objects are not duplicated but can be re-used wherever needed.

This section includes the following topics:

- [Information About Objects, page 13-2](#)

- [Information About Object Groups, page 13-2](#)

Information About Objects

Objects are created in and used by the ASA in the place of an inline IP address in any given configuration. You can define an object with a particular IP address and netmask pair or a protocol (and, optionally, a port) and use this object in several configurations. The advantage is that whenever you want to modify the configurations created to this IP address or protocol, you do not need to modify all rules in the running configuration. You can modify the object, and then the change automatically applies to all rules that use the specified object. You can configure two types of objects: network objects and service objects. These objects can be used in Network Address Translation (NAT), access lists, and object groups.

Information About Object Groups

By grouping like objects together, you can use the object group in an ACE instead of having to enter an ACE for each object separately. You can create the following types of object groups:

- Protocol
- Network
- Service
- ICMP type

For example, consider the following three object groups:

- MyServices—Includes the TCP and UDP port numbers of the service requests that are allowed access to the internal network.
- TrustedHosts—Includes the host and network addresses allowed access to the greatest range of services and servers.
- PublicServers—Includes the host addresses of servers to which the greatest access is provided.

After creating these groups, you could use a single ACE to allow trusted hosts to make specific service requests to a group of public servers.

You can also nest object groups in other object groups.

Licensing Requirements for Objects and Groups

The following table shows the licensing requirements for this feature:

Model	License Requirement
All models	Base License.

Guidelines and Limitations for Objects and Groups

This section includes the guidelines and limitations for this feature.

Context Mode Guidelines

Supported in single and multiple context mode.

Firewall Mode Guidelines

Supported in routed and transparent firewall modes.

IPv6 Guidelines

Supports IPv6, with limitations. (See the [“Additional Guidelines and Limitations”](#) section on page 13-3.)

Additional Guidelines and Limitations

The following guidelines and limitations apply to object groups:

- Objects and object groups share the same name space.
- Object groups must have unique names. While you might want to create a network object group named “Engineering” and a service object group named “Engineering,” you need to add an identifier (or “tag”) to the end of at least one object group name to make it unique. For example, you can use the names “Engineering_admins” and “Engineering_hosts” to make the object group names unique and to aid in identification.
- You cannot remove an object group or make an object group empty if it is used in a command.
- The ASA does not support IPv6 nested object groups, so you cannot group an object with IPv6 entities under another IPv6 object group.

Configuring Objects

This section includes the following topics:

- [Configuring a Network Object, page 13-3](#)
- [Configuring a Service Object, page 13-4](#)

Configuring a Network Object

A network object contains a single IP address/mask pair. Network objects can be of three types: host, subnet, or range.

You can also configure auto NAT as part of the object definition; see [Chapter 30, “Configuring Network Object NAT,”](#) for more information.

Detailed Steps

	Command	Purpose
Step 1	object network <i>obj_name</i> Example: hostname(config)# object-network OBJECT1	Creates a new network object. The <i>obj_name</i> is a text string up to 64 characters in length and can be any combination of letters, digits, and the following characters: • underscore “_” • dash “-” • period “.” The prompt changes to network object configuration mode.
Step 2	{host <i>ip_addr</i> subnet <i>net_addr net_mask</i> range <i>ip_addr_1 ip_addr_2</i> Example: hostname(config-network-object)# host 10.2.2.2	Assigns the IP address to the named object. You can configure a host address, a subnet, or a range of addresses.
Step 3	description <i>text</i> Example: hostname(config-network-object)# description Engineering Network	Adds a description to the object.

Examples

To create a network object, enter the following commands:

```
hostname (config)# object network OBJECT1
hostname (config-network-object)# host 10.2.2.2
```

Configuring a Service Object

A service object contains a protocol and optional source and/or destination port.

Detailed Steps

	Command	Purpose
Step 1	object service <i>obj_name</i> Example: <pre>hostname(config)# object-service SERVOBJECT1</pre>	Creates a new service object. The <i>obj_name</i> is a text string up to 64 characters in length and can be any combination of letters, digits, and the following characters: • underscore “_” • dash “-” • period “.” The prompt changes to service object configuration mode.
Step 2	<pre>service {<i>protocol</i> icmp <i>icmp-type</i> icmp6 <i>icmp6-type</i> {tcp udp} [source <i>operator</i> <i>port</i>] [destination <i>operator</i> <i>port</i>]}</pre> Example: <pre>hostname(config-service-object)# service tcp source eq www destination eq ssh</pre>	Creates a service object for the source mapped address. The <i>protocol</i> argument specifies an IP protocol name or number. The icmp, tcp, or udp keywords specify that this service object is for either the ICMP, TCP, or UDP protocol. The <i>icmp-type</i> argument names the ICMP type. The icmp6 keyword specifies that the service type is for ICMP version 6 connections. The <i>icmp6-type</i> argument names the ICMP version 6 type. The source keyword specifies the source port. The destination keyword specifies the destination port. The <i>operator port</i> argument specifies a single port/code value that supports configuring the port for the protocol. You can specify “eq,” “neq,” “lt,” “gt,” and “range” when configuring a port for TCP or UDP. The “range” operator lists the beginning port and ending port.

Example

To create a service object, enter the following commands:

```
hostname (config)# object service SERVOBJECT1
hostname (config-service-object)# service tcp source eq www destination eq ssh
```

Configuring Object Groups

This section includes the following topics:

- [Adding a Protocol Object Group, page 13-6](#)
- [Adding a Network Object Group, page 13-7](#)
- [Adding a Service Object Group, page 13-8](#)
- [Adding an ICMP Type Object Group, page 13-9](#)
- [Nesting Object Groups, page 13-10](#)
- [Removing Object Groups, page 13-11](#)

Adding a Protocol Object Group

To add or change a protocol object group, perform the steps in this section. After you add the group, you can add more objects as required by following this procedure again for the same group name and specifying additional objects. You do not need to reenter existing objects; the commands you already set remain in place unless you remove them with the **no** form of the command.

Detailed Steps

	Command	Purpose
Step 1	object-group protocol <i>obj_grp_id</i> Example: <pre>hostname(config)# object-group protocol tcp_udp_icmp</pre>	Adds a protocol group. The <i>obj_grp_id</i> is a text string up to 64 characters in length and can be any combination of letters, digits, and the following characters: • underscore “_” • dash “-” • period “.” The prompt changes to protocol configuration mode.
Step 2	description <i>text</i> Example: <pre>hostname(config-protocol)# description New Group</pre>	(Optional) Adds a description. The description can be up to 200 characters.
Step 3	protocol-object <i>protocol</i> Example: <pre>hostname(config-protocol)# protocol-object tcp</pre>	Defines the protocols in the group. Enter the command for each protocol. The protocol is the numeric identifier of the specified IP protocol (1 to 254) or a keyword identifier (for example, icmp , tcp , or udp). To include all IP protocols, use the keyword ip . For a list of protocols that you can specify, see the “Protocols and Applications” section on page B-11.

Example

To create a protocol group for TCP, UDP, and ICMP, enter the following commands:

```
hostname (config)# object-group protocol tcp_udp_icmp
hostname (config-protocol)# protocol-object tcp
hostname (config-protocol)# protocol-object udp
```

```
hostname (config-protocol)# protocol-object icmp
```

Adding a Network Object Group

A network object group supports IPv4 and IPv6 addresses.

To add or change a network object group, perform the steps in this section. After you add the group, you can add more objects as required by following this procedure again for the same group name and specifying additional objects. You do not need to reenter existing objects; the commands you already set remain in place unless you remove them with the no form of the command.

Detailed Steps

	Command	Purpose
Step 1	object-group network <i>grp_id</i> Example: hostname(config)# object-group network admins	Adds a network group. The <i>grp_id</i> is a text string up to 64 characters in length and can be any combination of letters, digits, and the following characters: • underscore “_” • dash “-” • period “.” The prompt changes to protocol configuration mode.
Step 2	description <i>text</i> Example: hostname(config-network)# description Administrator Addresses	(Optional) Adds a description. The description can be up to 200 characters.
Step 3	network-object { object <i>name</i> <i>host ip_address</i> <i>ip_address mask</i> } Example: hostname(config-network)# network-object host 10.2.2.4	The object keyword adds an additional object to the network object group. Defines the networks in the group. Enter the command for each network or address.

Example

To create a network group that includes the IP addresses of three administrators, enter the following commands:

```
hostname (config)# object-group network admins
hostname (config-protocol)# description Administrator Addresses
hostname (config-protocol)# network-object host 10.2.2.4
hostname (config-protocol)# network-object host 10.2.2.78
hostname (config-protocol)# network-object host 10.2.2.34
```

Adding a Service Object Group

To add or change a service object group, perform the steps in this section. After you add the group, you can add more objects as required by following this procedure again for the same group name and specifying additional objects. You do not need to reenter existing objects; the commands you already set remain in place unless you remove them with the **no** form of the command.

Detailed Steps

	Command	Purpose
Step 1	object-group service <i>grp_id</i> {tcp udp tcp-udp} Example: <pre>hostname(config)# object-group service services1 tcp-udp</pre>	Adds a service group. The object keyword adds an additional object to the service object group. The <i>grp_id</i> is a text string up to 64 characters in length and can be any combination of letters, digits, and the following characters: - underscore “_” - dash “-” - period “.” Specify the protocol for the services (ports) you want to add with either the tcp, udp, or tcp-udp keywords. Enter the tcp-udp keyword if your service uses both TCP and UDP with the same port number, for example, DNS (port53). The prompt changes to service configuration mode.
Step 2	description <i>text</i> Example: <pre>hostname(config-service)# description DNS Group</pre>	(Optional) Adds a description. The description can be up to 200 characters.
Step 3	port-object {eq <i>port</i> range <i>begin_port</i> <i>end_port</i>} Example: <pre>hostname(config-service)# port-object eq domain</pre>	Defines the ports in the group. Enter the command for each port or range of ports. For a list of permitted keywords and well-known port assignments, see the “Protocols and Applications” section on page B-11.

Example

To create service groups that include DNS (TCP/UDP), LDAP (TCP), and RADIUS (UDP), enter the following commands:

```
hostname (config)# object-group service services1 tcp-udp
hostname (config-service)# description DNS Group
hostname (config-service)# port-object eq domain

hostname (config)# object-group service services2 udp
hostname (config-service)# description RADIUS Group
hostname (config-service)# port-object eq radius
```

```
hostname (config-service)# port-object eq radius-acct

hostname (config)# object-group service services3 tcp
hostname (config-service)# description LDAP Group
hostname (config-service)# port-object eq ldap
```

Adding an ICMP Type Object Group

To add or change an ICMP type object group, perform the steps in this section. After you add the group, you can add more objects as required by following this procedure again for the same group name and specifying additional objects. You do not need to reenter existing objects; the commands you already set remain in place unless you remove them with the **no** form of the command.

Detailed Steps

	Command	Purpose
Step 1	object-group icmp-type <i>grp_id</i> Example: hostname(config)# object-group icmp-type ping	Adds an ICMP type object group. The <i>grp_id</i> is a text string up to 64 characters in length and can be any combination of letters, digits, and the following characters: - underscore “_” - dash “-” - period “.” The prompt changes to ICMP type configuration mode.
Step 2	description <i>text</i> Example: hostname(config-icmp-type)# description Ping Group	(Optional) Adds a description. The description can be up to 200 characters.
Step 3	icmp-object <i>icmp-type</i> Example: hostname(config-icmp-type)# icmp-object echo-reply	Defines the ICMP types in the group. Enter the command for each type. For a list of ICMP types, see the “ICMP Types” section on page B-15 .

Example

Create an ICMP type group that includes echo-reply and echo (for controlling ping) by entering the following commands:

```
hostname (config)# object-group icmp-type ping
hostname (config-service)# description Ping Group
hostname (config-service)# icmp-object echo
hostname (config-service)# icmp-object echo-reply
```

Nesting Object Groups

You can nest object groups hierarchically so that one object group can contain other object groups of the same type and you can mix and match nested group objects and regular objects within an object group. The ASA does not support IPv6 nested object groups, however, so you cannot group an object with IPv6 entities under another IPv6 object-group.

To nest an object group within another object group of the same type, first create the group that you want to nest (see the [“Configuring Object Groups”](#) section on page 13-6), and then perform the steps in this section.

Detailed Steps

	Command	Purpose
Step 1	object-group group {{protocol network icmp-type} grp_id service grp_id {tcp udp tcp-udp}} Example: hostname(config)# object-group network Engineering_group	Adds or edits the specified object group type under which you want to nest another object group. The service_grp_id is a text string up to 64 characters in length and can be any combination of letters, digits, and the following characters: • underscore “_” • dash “-” • period “.”
Step 2	group-object group_id Example: hostname(config-network)# group-object Engineering_groups	Adds the specified group under the object group you specified in Step 1. The nested group must be of the same type. You can mix and match nested group objects and regular objects within an object group.

Examples

Create network object groups for privileged users from various departments by entering the following commands:

```
hostname (config)# object-group network eng
hostname (config-network)# network-object host 10.1.1.5
hostname (config-network)# network-object host 10.1.1.9
hostname (config-network)# network-object host 10.1.1.89

hostname (config)# object-group network hr
hostname (config-network)# network-object host 10.1.2.8
hostname (config-network)# network-object host 10.1.2.12

hostname (config)# object-group network finance
hostname (config-network)# network-object host 10.1.4.89
hostname (config-network)# network-object host 10.1.4.100
```

You then nest all three groups together as follows:

```
hostname (config)# object-group network admin
hostname (config-network)# group-object eng
hostname (config-network)# group-object hr
hostname (config-network)# group-object finance
```

You only need to specify the admin object group in your ACE as follows:

```
hostname (config)# access-list ACL_IN extended permit ip object-group admin host
209.165.201.29
```

Removing Object Groups

You can remove a specific object group or remove all object groups of a specified type; however, you cannot remove an object group or make an object group empty if it is used in an access list.

Detailed Step

Step 1 Do one of the following:

no object-group *grp_id*

Example:

```
hostname(config)# no object-group
Engineering_host
```

Removes the specified object group. The *grp_id* is a text string up to 64 characters in length and can be any combination of letters, digits, and the following characters:

- underscore “_”
- dash “-”
- period “.”

clear object-group [**protocol** | **network** | **services** | **icmp-type**]

Example:

```
hostname(config)# clear-object group
network
```

Removes all object groups of the specified type.

Note If you do not enter a type, all object groups are removed.

Monitoring Objects and Groups

To monitor objects and groups, enter the following commands:

Command	Purpose
show access-list	Displays the access list entries that are expanded out into individual entries without their object groupings.
show running-config object-group	Displays all current object groups.
show running-config object-group <i>grp_id</i>	Displays the current object groups by their group ID.
show running-config object-group <i>grp_type</i>	Displays the current object groups by their group type.

Feature History for Objects and Groups

Table 1 lists the release history for this feature.

Table 1 Feature History for Object Groups

Feature Name	Releases	Feature Information
Object groups	7.0(1)	Object groups simplify access list creation and maintenance. We introduced or modified the following commands: object-group <i>protocol</i> , object-group <i>network</i> , object-group <i>service</i> , object-group <i>icmp_type</i> .
Objects	8.3(1)	Object support was introduced. We introduced or modified the following commands: object-network , object-service , object-group <i>network</i> , object-group <i>service</i> , network object , access-list extended , access-list <i>webtype</i> , access-list <i>remark</i> .

Configuring Regular Expressions

A regular expression matches text strings either literally as an exact string, or by using *metacharacters* so that you can match multiple variants of a text string. You can use a regular expression to match the content of certain application traffic; for example, you can match a URL string inside an HTTP packet. This section describes how to create a regular expression and includes the following topics:

- [Creating a Regular Expression, page 13-12](#)
- [Creating a Regular Expression Class Map, page 13-15](#)

Creating a Regular Expression

A regular expression matches text strings either literally as an exact string, or by using *metacharacters* so you can match multiple variants of a text string. You can use a regular expression to match the content of certain application traffic; for example, you can match a URL string inside an HTTP packet.

Guidelines

Use **Ctrl+V** to escape all of the special characters in the CLI, such as question mark (?) or a tab. For example, type **d[Ctrl+V]?g** to enter **d?g** in the configuration.

See the **regex** command in the *Cisco ASA 5500 Series Command Reference* for performance impact information when matching a regular expression to packets.

Note

As an optimization, the ASA searches on the deobfuscated URL. Deobfuscation compresses multiple forward slashes (/) into a single slash. For strings that commonly use double slashes, like “http://”, be sure to search for “http:/" instead.

Table 13-2 lists the metacharacters that have special meanings.

Table 13-2 *regex Metacharacters*

Character	Description	Notes
.	Dot	Matches any single character. For example, d.g matches dog, dag, dtg, and any word that contains those characters, such as doggonnit.
(exp)	Subexpression	A subexpression segregates characters from surrounding characters, so that you can use other metacharacters on the subexpression. For example, d(ola)g matches dog and dag, but dolag matches do and ag. A subexpression can also be used with repeat quantifiers to differentiate the characters meant for repetition. For example, ab(xy){3}z matches abxyxyxyz.
	Alternation	Matches either expression it separates. For example, dog cat matches dog or cat.
?	Question mark	A quantifier that indicates that there are 0 or 1 of the previous expression. For example, lo?se matches lse or lose. Note You must enter Ctrl+V and then the question mark or else the help function is invoked.
*	Asterisk	A quantifier that indicates that there are 0, 1 or any number of the previous expression. For example, lo*se matches lse, lose, loose, and so on.
+	Plus	A quantifier that indicates that there is at least 1 of the previous expression. For example, lo+se matches lose and loose, but not lse.
{x} or {x,}	Minimum repeat quantifier	Repeat at least <i>x</i> times. For example, ab(xy){2,}z matches abxyxyz, abxyxyxyz, and so on.
[abc]	Character class	Matches any character in the brackets. For example, [abc] matches a, b, or c.
[^abc]	Negated character class	Matches a single character that is not contained within the brackets. For example, [^abc] matches any character other than a, b, or c. [^A-Z] matches any single character that is not an uppercase letter.
[a-c]	Character range class	Matches any character in the range. [a-z] matches any lowercase letter. You can mix characters and ranges: [abcq-z] matches a, b, c, q, r, s, t, u, v, w, x, y, z, and so does [a-cq-z] . The dash (-) character is literal only if it is the last or the first character within the brackets: [abc-] or [-abc] .
“”	Quotation marks	Preserves trailing or leading spaces in the string. For example, “ test ” preserves the leading space when it looks for a match.
^	Caret	Specifies the beginning of a line.

Table 13-2 *regex Metacharacters (continued)*

Character	Description	Notes
\	Escape character	When used with a metacharacter, matches a literal character. For example, \[matches the left square bracket.
<i>char</i>	Character	When character is not a metacharacter, matches the literal character.
\r	Carriage return	Matches a carriage return 0x0d.
\n	Newline	Matches a new line 0x0a.
\t	Tab	Matches a tab 0x09.
\f	Formfeed	Matches a form feed 0x0c.
\xNN	Escaped hexadecimal number	Matches an ASCII character using hexadecimal (exactly two digits).
\NNN	Escaped octal number	Matches an ASCII character as octal (exactly three digits). For example, the character 040 represents a space.

Detailed Steps

- Step 1** To test a regular expression to make sure it matches what you think it will match, enter the following command:

```
hostname(config)# test regex input_text regular_expression
```

Where the *input_text* argument is a string you want to match using the regular expression, up to 201 characters in length.

The *regular_expression* argument can be up to 100 characters in length.

Use **Ctrl+V** to escape all of the special characters in the CLI. For example, to enter a tab in the input text in the **test regex** command, you must enter **test regex “test[Ctrl+V Tab]” “test\t”**.

If the regular expression matches the input text, you see the following message:

```
INFO: Regular expression match succeeded.
```

If the regular expression does not match the input text, you see the following message:

```
INFO: Regular expression match failed.
```

- Step 2** To add a regular expression after you tested it, enter the following command:

```
hostname(config)# regex name regular_expression
```

Where the *name* argument can be up to 40 characters in length.

The *regular_expression* argument can be up to 100 characters in length.

Examples

The following example creates two regular expressions for use in an inspection policy map:

```
hostname(config)# regex url_example example\.com
```

```
hostname(config)# regex url_example2 example2\.com
```

Creating a Regular Expression Class Map

A regular expression class map identifies one or more regular expressions. You can use a regular expression class map to match the content of certain traffic; for example, you can match URL strings inside HTTP packets.

Detailed Steps

Step 1 Create one or more regular expressions according to the [“Configuring Regular Expressions”](#) section.

Step 2 Create a class map by entering the following command:

```
hostname(config)# class-map type regex match-any class_map_name  
hostname(config-cmap)#
```

Where *class_map_name* is a string up to 40 characters in length. The name “class-default” is reserved. All types of class maps use the same name space, so you cannot reuse a name already used by another type of class map.

The **match-any** keyword specifies that the traffic matches the class map if it matches at least one of the regular expressions.

The CLI enters class-map configuration mode.

Step 3 (Optional) Add a description to the class map by entering the following command:

```
hostname(config-cmap)# description string
```

Step 4 Identify the regular expressions you want to include by entering the following command for each regular expression:

```
hostname(config-cmap)# match regex regex_name
```

Examples

The following example creates two regular expressions, and adds them to a regular expression class map. Traffic matches the class map if it includes the string “example.com” or “example2.com.”

```
hostname(config)# regex url_example example\.com  
hostname(config)# regex url_example2 example2\.com  
hostname(config)# class-map type regex match-any URLs  
hostname(config-cmap)# match regex url_example  
hostname(config-cmap)# match regex url_example2
```

Scheduling Extended Access List Activation

This section includes the following topics:

- [Information About Scheduling Access List Activation, page 13-16](#)
- [Licensing Requirements for Scheduling Access List Activation, page 13-16](#)
- [Guidelines and Limitations for Scheduling Access List Activation, page 13-16](#)
- [Configuring and Applying Time Ranges, page 13-17](#)
- [Configuration Examples for Scheduling Access List Activation, page 13-18](#)
- [Feature History for Scheduling Access List Activation, page 13-18](#)

Information About Scheduling Access List Activation

You can schedule each ACE in an access list to be activated at specific times of the day and week by applying a time range to the ACE.

Licensing Requirements for Scheduling Access List Activation

The following table shows the licensing requirements for this feature:

Model	License Requirement
All models	Base License.

Guidelines and Limitations for Scheduling Access List Activation

This section includes the guidelines and limitations for this feature.

Context Mode Guidelines

Supported in single and multiple context mode.

Firewall Mode Guidelines

Supported in routed and transparent firewall modes.

IPv6 Guidelines

Supports IPv6.

Additional Guidelines and Limitations

The following guidelines and limitations apply to using object groups with access lists:

- Users could experience a delay of approximately 80 to 100 seconds after the specified end time for the ACL to become inactive. For example, if the specified end time is 3:50, because the end time is inclusive, the command is picked up anywhere between 3:51:00 and 3:51:59. After the command is picked up, the ASA finishes any currently running task and then services the command to deactivate the ACL.
- Multiple periodic entries are allowed per **time-range** command. If a **time-range** command has both **absolute** and **periodic** values specified, then the **periodic** commands are evaluated only after the **absolute** start time is reached, and they are not further evaluated after the **absolute** end time is reached.

Configuring and Applying Time Ranges

You can add a time range to implement a time-based access list. To identify the time range, perform the steps in this section.

Detailed Steps

	Command	Purpose
Step 1	time-range <i>name</i> Example: hostname(config)# time range Sales	Identifies the time-range name.
Step 2	Do one of the following: periodic <i>days-of-the-week time to</i> <i>[days-of-the-week] time</i> Example: hostname(config-time-range)# periodic monday 7:59 to friday 17:01	Specifies a recurring time range. You can specify the following values for <i>days-of-the-week</i> : • monday, tuesday, wednesday, thursday, friday, saturday, or sunday. • daily • weekdays • weekend The <i>time</i> is in the format <i>hh:mm</i> . For example, 8:00 is 8:00 a.m. and 20:00 is 8:00 p.m.

Command	Purpose
absolute start <i>time date</i> [end <i>time date</i>] Example: hostname(config-time-range)# absolute start 7:59 2 january 2009	Specifies an absolute time range. The <i>time</i> is in the format <i>hh:mm</i> . For example, 8:00 is 8:00 a.m. and 20:00 is 8:00 p.m. The <i>date</i> is in the format <i>day month year</i> ; for example, 1 january 2006 .
Step 3 access-list <i>access_list_name</i> [extended] { deny / permit }...[time-range <i>name</i>] Example: hostname(config)# access list Marketing extended deny tcp host 209.165.200.225 host 209.165.201.1 time-range Pacific_Coast	Applies the time range to an ACE.  Note If you also enable logging for the ACE, use the log keyword before the time-range keyword. If you disable the ACE using the inactive keyword, use the inactive keyword as the last keyword. See Chapter 15, “Adding an Extended Access List,” for complete access-list command syntax.

Example

The following example binds an access list named “Sales” to a time range named “New_York_Minute”:

```
hostname(config)# access-list Sales line 1 extended deny tcp host 209.165.200.225 host
209.165.201.1 time-range New_York_Minute
```

Configuration Examples for Scheduling Access List Activation

The following is an example of an absolute time range beginning at 8:00 a.m. on January 1, 2006. Because no end time and date are specified, the time range is in effect indefinitely.

```
hostname(config)# time-range for2006
hostname(config-time-range)# absolute start 8:00 1 january 2006
```

The following is an example of a weekly periodic time range from 8:00 a.m. to 6:00 p.m on weekdays:

```
hostname(config)# time-range workinghours
hostname(config-time-range)# periodic weekdays 8:00 to 18:00
```

Feature History for Scheduling Access List Activation

[Table 13-3](#) lists the release history for this feature.

Table 13-3 Feature History for Scheduling Access List Activation

Feature Name	Releases	Feature Information
Scheduling access list activation	7.0	You can schedule each ACE in an access list to be activated at specific times of the day and week. We introduced or mofied the following commands: object-group <i>protocol</i> , object-group <i>network</i> , object-group <i>service</i> , object-group <i>icmp_type</i> .

CHAPTER 14

Information About Access Lists

Cisco ASAs provide basic traffic filtering capabilities with access lists, which control access in your network by preventing certain traffic from entering or exiting. This chapter describes access lists and shows how to add them to your network configuration.

Access lists are made up of one or more access control entries (ACEs). An ACE is a single entry in an access list that specifies a permit or deny rule (to forward or drop the packet) and is applied to a protocol, to a source and destination IP address or network, and, optionally, to the source and destination ports.

Access lists can be configured for all routed and network protocols (IP, AppleTalk, and so on) to filter the packets of those protocols as the packets pass through a router.

Access lists are used in a variety of features. If your feature uses Modular Policy Framework, you can use an access list to identify traffic within a traffic class map. For more information on Modular Policy Framework, see [Chapter 32, “Configuring a Service Policy Using the Modular Policy Framework.”](#)

This chapter includes the following sections:

- [Access List Types, page 14-1](#)
- [Access Control Entry Order, page 14-2](#)
- [Access Control Implicit Deny, page 14-3](#)
- [IP Addresses Used for Access Lists When You Use NAT, page 14-3](#)
- [Where to Go Next, page 14-3](#)

Access List Types

The ASA uses five types of access control lists:

- Standard access lists—Identify the destination IP addresses of OSPF routes and can be used in a route map for OSPF redistribution. Standard access lists cannot be applied to interfaces to control traffic. For more information, see [Chapter 17, “Adding a Standard Access List.”](#)
- Extended access lists—Use one or more access control entries (ACE) in which you can specify the line number to insert the ACE, the source and destination addresses, and, depending upon the ACE type, the protocol, the ports (for TCP or UDP), or the ICMP type (for ICMP). For more information, see [Chapter 15, “Adding an Extended Access List.”](#)
- EtherType access lists—Use one or more ACEs that specify an EtherType. For more information, see [Chapter 16, “Adding an EtherType Access List.”](#)
- Webtype access lists—Used in a configuration that supports filtering for clientless SSL VPN. For more information, see [Chapter 18, “Adding a Webtype Access List.”](#)

- IPv6 access lists—Determine which IPv6 traffic to block and which traffic to forward at router interfaces. For more information, see [Chapter 19, “Adding an IPv6 Access List.”](#)

[Table 14-1](#) lists the types of access lists and some common uses for them.

Table 14-1 *Access List Types and Common Uses*

Access List Use	Access List Type	Description
Control network access for IP traffic (routed and transparent mode)	Extended	The ASA does not allow any traffic from a lower security interface to a higher security interface unless it is explicitly permitted by an extended access list. Note To access the ASA interface for management access, you do not also need an access list allowing the host IP address. You only need to configure management access according to Chapter 37, “Configuring Management Access.”
Identify traffic for AAA rules	Extended	AAA rules use access lists to identify traffic.
Control network access for IP traffic for a given user	Extended, downloaded from a AAA server per user	You can configure the RADIUS server to download a dynamic access list to be applied to the user, or the server can send the name of an access list that you already configured on the ASA.
Identify addresses for NAT (policy NAT and NAT exemption)	Extended	Policy NAT lets you identify local traffic for address translation by specifying the source and destination addresses in an extended access list.
Establish VPN access	Extended	You can use an extended access list in VPN commands.
Identify traffic in a traffic class map for Modular Policy Framework	Extended EtherType	Access lists can be used to identify traffic in a class map, which is used for features that support Modular Policy Framework. Features that support Modular Policy Framework include TCP and general connection settings, and inspection.
For transparent firewall mode, control network access for non-IP traffic	EtherType	You can configure an access list that controls traffic based on its EtherType.
Identify OSPF route redistribution	Standard	Standard access lists include only the destination address. You can use a standard access list to control the redistribution of OSPF routes.
Filtering for WebVPN	Webtype	You can configure a Webtype access list to filter URLs.
Control network access for IPV6 networks	IPv6	You can add and apply access lists to control traffic in IPv6 networks.

Access Control Entry Order

An access list is made up of one or more access control entries (ACEs). Each ACE that you enter for a given access list name is appended to the end of the access list. Depending on the access list type, you can specify the source and destination addresses, the protocol, the ports (for TCP or UDP), the ICMP type (for ICMP), or the EtherType.

The order of ACEs is important. When the ASA decides whether to forward or to drop a packet, the ASA tests the packet against each ACE in the order in which the entries are listed. After a match is found, no more ACEs are checked. For example, if you create an ACE at the beginning of an access list that explicitly permits all traffic, no further statements are checked, and the packet is forwarded.

Access Control Implicit Deny

All access lists (except Extended access lists) have an implicit deny statement at the end, so unless you explicitly permit traffic to pass, it will be denied. For example, if you want to allow all users to access a network through the ASA except for one or more particular addresses, then you need to deny those particular addresses and then permit all others.

For EtherType access lists, the implicit deny at the end of the access list does not affect IP traffic or ARPs; for example, if you allow EtherType 8037, the implicit deny at the end of the access list does not now block any IP traffic that you previously allowed with an extended access list (or implicitly allowed from a high security interface to a low security interface). However, if you *explicitly* deny all traffic with an EtherType ACE, then IP and ARP traffic is denied.

IP Addresses Used for Access Lists When You Use NAT

For the following features, you should always use the *real* IP address in the access list when you use NAT, even if the address as seen on an interface is the mapped address:

- **access-group** command
- Modular Policy Framework **match access-list** command
- Botnet Traffic Filter **dynamic-filter enable classify-list** command
- AAA **aaa ... match** commands
- WCCP **wccp redirect-list group-list** command

The following features use access lists, but these access lists use the *mapped* values as seen on an interface:

- IPsec access lists
- capture command access lists
- Per-user access lists
- Routing protocols
- All other features...

Where to Go Next

For information about implementing access lists, see the following chapters in this guide:

- [Chapter 15, “Adding an Extended Access List”](#)
- [Chapter 16, “Adding an EtherType Access List”](#)

- [Chapter 17, “Adding a Standard Access List”](#)
- [Chapter 18, “Adding a Webtype Access List”](#)
- [Chapter 19, “Adding an IPv6 Access List”](#)
- [Chapter 34, “Configuring Access Rules”](#)

CHAPTER 15

Adding an Extended Access List

This chapter describes how to configure extended access lists (also known as access control lists), and it includes the following sections:

- [Information About Extended Access Lists, page 15-1](#)
- [Licensing Requirements for Extended Access Lists, page 15-1](#)
- [Guidelines and Limitations, page 15-2](#)
- [Default Settings, page 15-2](#)
- [Configuring Extended Access Lists, page 15-3](#)
- [Monitoring Extended Access Lists, page 15-5](#)
- [Configuration Examples for Extended Access Lists, page 15-5](#)
- [Where to Go Next, page 15-7](#)
- [Feature History for Extended Access Lists, page 15-7](#)

Information About Extended Access Lists

Access lists are used to control network access or to specify traffic for many features to act upon. An extended access list is made up of one or more access control entries (ACE) in which you can specify the line number to insert the ACE, the source and destination addresses, and, depending upon the ACE type, the protocol, the ports (for TCP or UDP), or the ICMP type. You can identify all of these parameters within the **access-list** command, or you can use objects for each parameter.

Licensing Requirements for Extended Access Lists

The following table shows the licensing requirements for this feature:

Model	License Requirement
All models	Base License.

Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

Context Mode Guidelines

Supported in single and multiple context mode.

Firewall Mode Guidelines

Supported only in routed and transparent firewall modes.

IPv6 Guidelines

IPv6 is supported.

Additional Guidelines and Limitations

The following guidelines and limitations apply to creating an extended access list:

- Enter the access list name in uppercase letters so that the name is easy to see in the configuration. You might want to name the access list for the interface (for example, INSIDE), or you can name it for the purpose for which it is created (for example, NO_NAT or VPN).
- Typically, you identify the **ip** keyword for the protocol, but other protocols are accepted. For a list of protocol names, see the [“Protocols and Applications” section on page B-11](#).
- You can specify the source and destination ports only for the TCP or UDP protocols. For a list of permitted keywords and well-known port assignments, see the [“TCP and UDP Ports” section on page B-11](#). DNS, Discard, Echo, Ident, NTP, RPC, SUNRPC, and Talk each require one definition for TCP and one for UDP. TACACS+ requires one definition for port 49 on TCP.
- When you specify a network mask, the method is different from the Cisco IOS software **access-list** command. The ASA uses a network mask (for example, 255.255.255.0 for a Class C mask). The Cisco IOS mask uses wildcard bits (for example, 0.0.0.255).

Default Settings

[Table 15-1](#) lists the default settings for extended access list parameters.

Table 15-1 Default Extended Access List Parameters

Parameters	Default
ACE logging	ACE logging generates system log message 106023 for denied packets. A deny ACE must be present to log denied packets.
log	When the log keyword is specified, the default level for system log message 106100 is 6 (informational), and the default interval is 300 seconds.

Configuring Extended Access Lists

This section shows how to add and delete an access control entry and access list, and it includes the following topics:

- [Adding an Extended Access List, page 15-3](#)
- [Adding Remarks to Access Lists, page 15-5](#)

Adding an Extended Access List

An access list is made up of one or more access control entries (ACEs) with the same access list ID. To create an access list you start by creating an ACE and applying a list name. An access list with one entry is still considered a list, although you can add multiple entries to the list.

Prerequisites

(Optional) Create an object or object group according to the [“Configuring Objects and Groups”](#) section on page 13-1.

Guidelines

To delete an ACE, enter the **no access-list** command with the entire command syntax string as it appears in the configuration. To remove the entire access list, use the **clear configure access-list** command.

Detailed Steps

Command	Purpose
(For IP traffic, no ports) <pre>access-list access_list_name [line line_number] extended {deny permit} {protocol object-group prot_grp_id} {source_address mask object nw_obj_id object-group nw_grp_id} {dest_address mask object nw_obj_id object-group nw_grp_id} [log [[level] [interval secs] disable default]] [inactive time-range time_range_name]</pre> (For TCP or UDP traffic, with ports) <pre>access-list access_list_name [line line_number] extended {deny permit} {tcp udp object-group prot_grp_id} {source_address mask object nw_obj_id object-group nw_grp_id} [operator port object-group svc_grp_id] {dest_address mask object nw_obj_id object-group nw_grp_id} [operator port object-group svc_grp_id] [log [[level] [interval secs] disable default]] [inactive time-range time_range_name]</pre> (For ICMP traffic) <pre>access-list access_list_name [line line_number] extended {deny permit} icmp {source_address mask object nw_obj_id object-group nw_grp_id} {dest_address mask object nw_obj_id object-group nw_grp_id} [icmp_type object-group icmp_grp_id] [log [[level] [interval secs] disable default]] [inactive time-range time_range_name]</pre> Example: <pre>hostname(config)# access-list ACL_IN extended permit ip any any</pre>	Adds an extended ACE. The line <i>line_number</i> option specifies the line number at which insert the ACE. If you do not specify a line number, the ACE is added to the end of the access list. The line number is not saved in the configuration; it only specifies where to insert the ACE. The deny keyword denies a packet if the conditions are matched. The permit keyword permits a packet if the conditions are matched. Instead of entering the protocol, IP address, or port directly in the command, you can use network objects, or protocol, network, port, or ICMP object groups using the object and object-group keyword. See “Configuring Objects and Groups” section on page 13-1 for more information about creating objects. The <i>protocol</i> argument specifies the IP protocol name or number. For example UDP is 17, TCP is 6, and EGP is 47. The <i>source_address</i> specifies the IP address of the network or host from which the packet is being sent. Enter the host keyword before the IP address to specify a single address. In this case, do not enter a mask. Enter the any keyword instead of the address and mask to specify any address. For the TCP and UDP protocols only, the <i>operator port</i> option matches the port numbers used by the source or destination. The permitted operators are as follows: • lt—less than. • gt—greater than. • dq—equal to. • neq—not equal to. • range—an inclusive range of values. When you use this operator, specify two port numbers, for example: range 100 200. The <i>dest_address</i> argument specifies the IP address of the network or host to which the packet is being sent. Enter the host keyword before the IP address to specify a single address. In this case, do not enter a mask. Enter the any keyword instead of the address and mask to specify any address. The <i>icmp_type</i> argument specifies the ICMP type if the protocol is ICMP. The time-range keyword specifies when an access list is activated. See the “Scheduling Extended Access List Activation” section on page 13-16 for more information. The inactive keyword disables an ACE. To reenablen it, enter the entire ACE without the inactive keyword. This feature enables you to keep a record of an inactive ACE in your configuration to make reenabling easier. For the log keyword, see Chapter 20, “Configuring Logging for Access Lists.”

Adding Remarks to Access Lists

You can include remarks about entries in any access list, including extended, EtherType, IPv6, standard, and Webtype access lists. The remarks make the access list easier to understand.

To add a remark after the last **access-list** command you entered, enter the following command:

Command	Purpose
access-list <i>access_list_name</i> remark <i>text</i>	Adds a remark after the last access-list command you entered. The text can be up to 100 characters in length. You can enter leading spaces at the beginning of the text. Trailing spaces are ignored.
Example: hostname(config)# access-list OUT remark - this is the inside admin address	If you enter the remark before any access-list command, then the remark is the first line in the access list. If you delete an access list using the no access-list <i>access_list_name</i> command, then all the remarks are also removed.

Example

You can add remarks before each ACE, and the remark appears in the access list in this location. Entering a dash (-) at the beginning of the remark helps set it apart from the ACEs.

```
hostname(config)# access-list OUT remark - this is the inside admin address
hostname(config)# access-list OUT extended permit ip host 209.168.200.3 any
hostname(config)# access-list OUT remark - this is the hr admin address
hostname(config)# access-list OUT extended permit ip host 209.168.200.4 any
```

Monitoring Extended Access Lists

To monitor extended access lists, enter one of the following commands:

Command	Purpose
show access list	Displays the access list entries by number.
show running-config access-list	Displays the current running access-list configuration.

Configuration Examples for Extended Access Lists

This section includes the following topics:

- [Configuration Examples for Extended Access Lists \(No Objects\)](#), page 15-6
- [Configuration Examples for Extended Access Lists \(Using Objects\)](#), page 15-6

Configuration Examples for Extended Access Lists (No Objects)

The following access list allows all hosts (on the interface to which you apply the access list) to go through the ASA:

```
hostname(config)# access-list ACL_IN extended permit ip any any
```

The following sample access list prevents hosts on 192.168.1.0/24 from accessing the 209.165.201.0/27 network. All other addresses are permitted.

```
hostname(config)# access-list ACL_IN extended deny tcp 192.168.1.0 255.255.255.0
209.165.201.0 255.255.255.224
hostname(config)# access-list ACL_IN extended permit ip any any
```

If you want to restrict access to selected hosts only, then enter a limited permit ACE. By default, all other traffic is denied unless explicitly permitted.

```
hostname(config)# access-list ACL_IN extended permit ip 192.168.1.0 255.255.255.0
209.165.201.0 255.255.255.224
```

The following access list restricts all hosts (on the interface to which you apply the access list) from accessing a website at address 209.165.201.29. All other traffic is allowed.

```
hostname(config)# access-list ACL_IN extended deny tcp any host 209.165.201.29 eq www
hostname(config)# access-list ACL_IN extended permit ip any any
```

The following access list that uses object groups restricts several hosts on the inside network from accessing several web servers. All other traffic is allowed.

```
hostname(config-network)# access-list ACL_IN extended deny tcp object-group denied
object-group web eq www
hostname(config)# access-list ACL_IN extended permit ip any any
hostname(config)# access-group ACL_IN in interface inside
```

The following example temporarily disables an access list that permits traffic from one group of network objects (A) to another group of network objects (B):

```
hostname(config)# access-list 104 permit ip host object-group A object-group B inactive
```

To implement a time-based access list, use the **time-range** command to define specific times of the day and week. Then use the **access-list extended** command to bind the time range to an access list. The following example binds an access list named “Sales” to a time range named “New_York_Minute.”

```
hostname(config)# access-list Sales line 1 extended deny tcp host 209.165.200.225 host
209.165.201.1 time-range New_York_Minute
```

Configuration Examples for Extended Access Lists (Using Objects)

The following normal access list that does not use object groups restricts several hosts on the inside network from accessing several web servers. All other traffic is allowed.

```
hostname(config)# access-list ACL_IN extended deny tcp host 10.1.1.4 host 209.165.201.29
eq www
hostname(config)# access-list ACL_IN extended deny tcp host 10.1.1.78 host 209.165.201.29
eq www
hostname(config)# access-list ACL_IN extended deny tcp host 10.1.1.89 host 209.165.201.29
eq www
hostname(config)# access-list ACL_IN extended deny tcp host 10.1.1.4 host 209.165.201.16
eq www
```

```

hostname(config)# access-list ACL_IN extended deny tcp host 10.1.1.78 host 209.165.201.16
eq www
hostname(config)# access-list ACL_IN extended deny tcp host 10.1.1.89 host 209.165.201.16
eq www
hostname(config)# access-list ACL_IN extended deny tcp host 10.1.1.4 host 209.165.201.78
eq www
hostname(config)# access-list ACL_IN extended deny tcp host 10.1.1.78 host 209.165.201.78
eq www
hostname(config)# access-list ACL_IN extended deny tcp host 10.1.1.89 host 209.165.201.78
eq www
hostname(config)# access-list ACL_IN extended permit ip any any
hostname(config)# access-group ACL_IN in interface inside

```

If you make two network object groups, one for the inside hosts, and one for the web servers, then the configuration can be simplified and can be easily modified to add more hosts:

```

hostname(config)# object-group network denied
hostname(config-network)# network-object host 10.1.1.4
hostname(config-network)# network-object host 10.1.1.78
hostname(config-network)# network-object host 10.1.1.89

hostname(config-network)# object-group network web
hostname(config-network)# network-object host 209.165.201.29
hostname(config-network)# network-object host 209.165.201.16
hostname(config-network)# network-object host 209.165.201.78

hostname(config-network)# access-list ACL_IN extended deny tcp object-group denied
object-group web eq www
hostname(config)# access-list ACL_IN extended permit ip any any
hostname(config)# access-group ACL_IN in interface inside

```

Where to Go Next

Apply the access list to an interface. See the [“Configuring Access Rules”](#) section on page 34-8 for more information.

Feature History for Extended Access Lists

Table 15-2 lists the release history for this feature.

Table 15-2 Feature History for Extended Access Lists

Feature Name	Releases	Feature Information
Extended access lists	7.0(1)	Access lists are used to control network access or to specify traffic for many features to act upon. An extended access control list is made up of one or more access control entries (ACE) in which you can specify the line number to insert the ACE, the source and destination addresses, and, depending upon the ACE type, the protocol, the ports (for TCP or UDP), or the ICMP type (for ICMP). We introduced the following command: access-list extended.

CHAPTER 16

Adding an EtherType Access List

This chapter describes how to configure EtherType access lists and includes the following sections:

- [Information About EtherType Access Lists, page 16-1](#)
- [Licensing Requirements for EtherType Access Lists, page 16-1](#)
- [Guidelines and Limitations, page 16-2](#)
- [Default Settings, page 16-2](#)
- [Configuring EtherType Access Lists, page 16-2](#)
- [Monitoring EtherType Access Lists, page 16-4](#)
- [What to Do Next, page 16-4](#)
- [Configuration Examples for EtherType Access Lists, page 16-5](#)
- [Feature History for EtherType Access Lists, page 16-5](#)

Information About EtherType Access Lists

An EtherType access list is made up of one or more Access Control Entries (ACEs) that specify an EtherType. An EtherType rule controls any EtherType identified by a 16-bit hexadecimal number.

For information about creating an access rule with the EtherType access list, see [Chapter 34, “Configuring Access Rules.”](#)

Licensing Requirements for EtherType Access Lists

The following table shows the licensing requirements for this feature:

Model	License Requirement
All models	Base License.

Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

Context Mode Guidelines

Available in single and multiple context modes.

Firewall Mode Guidelines

Supported in transparent firewall mode only.

IPv6 Guidelines

Supports IPv6.

Additional Guidelines and Limitations

The following guidelines and limitations apply to EtherType access lists:

- For EtherType access lists, the implicit deny at the end of the access list does not affect IP traffic or ARPs; for example, if you allow EtherType 8037, the implicit deny at the end of the access list does not now block any IP traffic that you previously allowed with an extended access list (or implicitly allowed from a high security interface to a low security interface). However, if you *explicitly* deny all traffic with an EtherType ACE, then IP and ARP traffic is denied.
- EtherType access lists support Ethernet V2 frames.
- 802.3-formatted frames are not handled by the access list because they use a length field as opposed to a type field. Bridge protocol data units, which are allowed by default, are the only exception; they are SNAP-encapsulated, and the ASA is designed to specifically handle BPDUs.

Default Settings

Access list logging generates system log message 106023 for denied packets. Deny packets must be present to log denied packets.

When you configure logging for the access list, the default severity level for system log message 106100 is 6 (informational).

Configuring EtherType Access Lists

This section includes the following topics:

- [Task Flow for Configuring EtherType Access Lists, page 16-2](#)
- [Adding EtherType Access Lists, page 16-3](#)
- [Adding Remarks to Access Lists, page 16-4](#)

Task Flow for Configuring EtherType Access Lists

Use the following guidelines to create and implement an access list:

- Step 1** Create an access list by adding an ACE and applying an access list name, as shown in the “Adding EtherType Access Lists” section on page 16-3.
- Step 2** Apply the access list to an interface. (See the “Configuring Access Rules” section on page 34-8 for more information.)

Adding EtherType Access Lists

To configure an access list that controls traffic based upon its EtherType, perform the following steps:

Detailed Steps

Command	Purpose
<pre>access-list access_list_name ethertype {deny permit} {ipx bpdud mpls-unicast mpls-multicast any hex_number}</pre> Example: <pre>hostname(config)# hostname(config)# access-list ETHER ethertype permit ipx</pre>	Adds an EtherType ACE. The <i>access_list_name</i> argument lists the name or number of an access list. When you specify an access list name, the ACE is added to the end of the access list. Enter the <i>access_list_name</i> in upper case letters so that the name is easy to see in the configuration. You might want to name the access list for the interface (for example, INSIDE) or for the purpose (for example, MPLS or PIX). The any keyword specifies access to anyone. The bpdud keyword specifies access to bridge protocol data units, which are allowed by default. The deny keyword denies access if the conditions are matched. If an EtherType access list is configured to deny all, all ethernet frames are discarded. Only physical protocol traffic, such as auto-negotiation, is still allowed. The <i>hex_number</i> argument indicates any EtherType that can be identified by a 16-bit hexadecimal number greater than or equal to 0x600. (See RFC 1700, “Assigned Numbers,” at http://www.ietf.org/rfc/rfc1700.txt for a list of EtherTypes.) The ipx keyword specifies access to IPX. The mpls-multicast keyword specifies access to MPLS multicast. The mpls-unicast keyword specifies access to MPLS unicast. The permit keyword permits access if the conditions are matched.  Note To remove an EtherType ACE, enter the no access-list command with the entire command syntax string as it appears in the configuration.

Example

The following sample access list allows common EtherTypes originating on the inside interface:

```
hostname(config)# access-list ETHER ethertype permit ipx
hostname(config)# access-list ETHER ethertype permit mpls-unicast
hostname(config)# access-group ETHER in interface inside
```

Adding Remarks to Access Lists

You can include remarks about entries in any access list, including extended, EtherType, IPv6, standard, and Webtype access lists. The remarks make an access list easier to understand.

To add a remark after the last **access-list** command you entered, enter the following command:

Command	Purpose
access-list <i>access_list_name</i> remark <i>text</i>	Adds a remark after the last access-list command you entered.
Example: hostname(config)# access-list OUT remark - this is the inside admin address	The text can be up to 100 characters in length. You can enter leading spaces at the beginning of the text. Trailing spaces are ignored. If you enter the remark before any access-list command, then the remark is the first line in the access list. If you delete an access list using the no access-list <i>access_list_name</i> command, then all remarks are also removed.

Example

You can add remarks before each ACE, and the remarks appear in the access list in these locations. Entering a dash (-) at the beginning of a remark helps to set it apart from the ACE.

```
hostname(config)# access-list OUT remark - this is the inside admin address
hostname(config)# access-list OUT extended permit ip host 209.168.200.3 any
hostname(config)# access-list OUT remark - this is the hr admin address
hostname(config)# access-list OUT extended permit ip host 209.168.200.4 any
```

What to Do Next

Apply the access list to an interface. (See the [“Configuring Access Rules”](#) section on page 34-8 for more information.)

Monitoring EtherType Access Lists

To monitor EtherType access lists, enter one of the following commands:

Command	Purpose
show access-list	Displays the access list entries by number.
show running-config access-list	Displays the current running access-list configuration.

Configuration Examples for EtherType Access Lists

The following example shows how to configure EtherType access lists:

The following access list allows some EtherTypes through the ASA, but it denies IPX:

```
hostname(config)# access-list ETHER ethertype deny ipx
hostname(config)# access-list ETHER ethertype permit 0x1234
hostname(config)# access-list ETHER ethertype permit mpls-unicast
hostname(config)# access-group ETHER in interface inside
hostname(config)# access-group ETHER in interface outside
```

The following access list denies traffic with EtherType 0x1256, but it allows all others on both interfaces:

```
hostname(config)# access-list nonIP ethertype deny 1256
hostname(config)# access-list nonIP ethertype permit any
hostname(config)# access-group ETHER in interface inside
hostname(config)# access-group ETHER in interface outside
```

Feature History for EtherType Access Lists

Table 16-1 lists the release history for this feature.

Table 16-1 Feature History for EtherType Access Lists

Feature Name	Releases	Feature Information
EtherType access lists	7.0(1)	EtherType access lists control traffic based upon its EtherType. We introduced the feature and the following command: access-list ethertype.

CHAPTER 17

Adding a Standard Access List

This chapter describes how to configure a standard access list and includes the following sections:

- [Information About Standard Access Lists, page 17-1](#)
- [Licensing Requirements for Standard Access Lists, page 17-1](#)
- [Guidelines and Limitations, page 17-1](#)
- [Default Settings, page 17-2](#)
- [Adding Standard Access Lists, page 17-3](#)
- [What to Do Next, page 17-4](#)
- [Monitoring Access Lists, page 17-4](#)
- [Configuration Examples for Standard Access Lists, page 17-4](#)
- [Feature History for Standard Access Lists, page 17-5](#)

Information About Standard Access Lists

Standard access lists identify the destination IP addresses of OSPF routes and can be used in a route map for OSPF redistribution. Standard access lists cannot be applied to interfaces to control traffic.

Licensing Requirements for Standard Access Lists

The following table shows the licensing requirements for this feature:

Model	License Requirement
All models	Base License.

Guidelines and Limitations

This section includes the guidelines and limitations for this feature:

- [Context Mode Guidelines, page 17-2](#)
- [Firewall Mode Guidelines, page 17-2](#)

- [IPv6 Guidelines, page 17-2](#)
- [Additional Guidelines and Limitations, page 17-2](#)

Context Mode Guidelines

Supported in single context mode only.

Firewall Mode Guidelines

Supported in routed and transparent firewall modes.

IPv6 Guidelines

Supports IPv6.

Additional Guidelines and Limitations

The following guidelines and limitations apply for standard Access Lists:

- Standard ACLs identify the destination IP addresses (not source addresses) of OSPF routes and can be used in a route map for OSPF redistribution. Standard ACLs cannot be applied to interfaces to control traffic.
- To add additional ACEs at the end of the access list, enter another **access-list** command, specifying the same access list name.
- When used with the **access-group** command, the **deny** keyword does not allow a packet to traverse the ASA. By default, the ASA denies all packets on the originating interface unless you specifically permit access.
- When specifying a source, local, or destination address, use the following guidelines:
 - Use a 32-bit quantity in four-part, dotted-decimal format.
 - Use the keyword **any** as an abbreviation for an address and mask of 0.0.0.0.0.0.0.
 - Use the **host ip_address** option as an abbreviation for a mask of 255.255.255.255.
- You can disable an ACE by specifying the keyword **inactive** in the **access-list** command.

Default Settings

[Table 17-1](#) lists the default settings for standard Access List parameters.

Table 17-1 Default Standard Access List Parameters

Parameters	Default
deny	The ASA denies all packets on the originating interface unless you specifically permit access. Access list logging generates system log message 106023 for denied packets. Deny packets must be present to log denied packets.

Adding Standard Access Lists

This section includes the following topics:

- [Task Flow for Configuring Extended Access Lists, page 17-3](#)
- [Adding a Standard Access List, page 17-3](#)
- [Adding Remarks to Access Lists, page 17-4](#)

Task Flow for Configuring Extended Access Lists

Use the following guidelines to create and implement an access list:

- Create an access list by adding an ACE and applying an access list name. See in the [“Adding Standard Access Lists” section on page 17-3](#).
- Apply the access list to an interface. See the [“Configuring Access Rules” section on page 34-8](#) for more information.

Adding a Standard Access List

To add an access list to identify the destination IP addresses of OSPF routes, which can be used in a route map for OSPF redistribution, enter the following command:

Command	Purpose
<pre>hostname(config)# access-list access_list_name standard {deny permit} {any ip_address mask}</pre> Example: <pre>hostname(config)# access-list OSPF standard permit 192.168.1.0 255.255.255.0</pre>	Adds a standard access list entry. To add another ACE to the end of the access list, enter another access-list command, specifying the same access list name. The <i>access_list_name</i> argument specifies the name of number of an access list. The any keyword specifies access to anyone. The deny keyword denies access if the conditions are matched. The host ip_address syntax specifies access to a host IP address. The <i>ip_address ip_mask</i> argument specifies access to a specific IP address and subnet mask. The line line-num option specifies the line number at which to insert an ACE. The permit keyword permits access if the conditions are matched. To remove an ACE, enter the no access-list command with the entire command syntax string as it appears in the configuration.

Adding Remarks to Access Lists

You can include remarks about entries in any access list, including extended, EtherType, IPv6, standard, and Webtype access lists. The remarks make the access list easier to understand.

To add a remark after the last **access-list** command you entered, enter the following command:

Command	Purpose
access-list <i>access_list_name</i> remark <i>text</i>	Adds a remark after the last access-list command you entered.
Example: hostname(config)# access-list OUT remark - this is the inside admin address	The text can be up to 100 characters in length. You can enter leading spaces at the beginning of the text. Trailing spaces are ignored. If you enter the remark before any access-list command, then the remark is the first line in the access list. If you delete an access list using the no access-list <i>access_list_name</i> command, then all the remarks are also removed.

Example

You can add a remark before each ACE, and the remarks appear in the access lists in these location. Entering a dash (-) at the beginning of a remark helps to set it apart from an ACE.

```
hostname(config)# access-list OUT remark - this is the inside admin address
hostname(config)# access-list OUT extended permit ip host 209.168.200.3 any
hostname(config)# access-list OUT remark - this is the hr admin address
hostname(config)# access-list OUT extended permit ip host 209.168.200.4 any
```

What to Do Next

Apply the access list to an interface. See the [“Configuring Access Rules” section on page 34-8](#) for more information.

Monitoring Access Lists

To monitor access lists, perform one of the following tasks:

Command	Purpose
show access-list	Displays the access list entries by number.
show running-config access-list	Displays the current running access-list configuration.

Configuration Examples for Standard Access Lists

The following example shows how to deny IP traffic through the ASA:

```
hostname(config)# access-list 77 standard deny
```

The following example shows how to permit IP traffic through the ASA if conditions are matched:

```
hostname(config)# access-list 77 standard permit
```

The following example shows how to specify a destination address:

```
hostname(config)# access-list 77 standard permit host 10.1.10.123
```

Feature History for Standard Access Lists

[Table 17-2](#) lists the release history for this feature.

Table 17-2 Feature History for Standard Access Lists

Feature Name	Releases	Feature Information
Standard access lists	7.0(1)	Standard access lists identify the destination IP addresses of OSPF routes, which can be used in a route map for OSPF redistribution. We introduced the feature and the following command: access-list standard.

CHAPTER 18

Adding a Webtype Access List

Webtype access lists are added to a configuration that supports filtering for clientless SSL VPN. This chapter describes how to add an access list to the configuration that supports filtering for WebVPN.

This chapter includes the following sections:

- [Licensing Requirements for Webtype Access Lists, page 18-1](#)
- [Guidelines and Limitations, page 18-1](#)
- [Default Settings, page 18-2](#)
- [Using Webtype Access Lists, page 18-2](#)
- [What to Do Next, page 18-5](#)
- [Monitoring Webtype Access Lists, page 18-5](#)
- [Configuration Examples for Webtype Access Lists, page 18-5](#)
- [Feature History for Webtype Access Lists, page 18-7](#)

Licensing Requirements for Webtype Access Lists

The following table shows the licensing requirements for this feature:

Model	License Requirement
All models	Base License.

Guidelines and Limitations

This section includes the guidelines and limitations for this feature:

- [Context Mode Guidelines, page 18-1](#)
- [Firewall Mode Guidelines, page 18-2](#)
- [Additional Guidelines and Limitations, page 18-2](#)

Context Mode Guidelines

Supported in single and multiple context mode.

Firewall Mode Guidelines

Supported in routed and transparent firewall mode.

IPv6 Guidelines

Supports IPv6.

Additional Guidelines and Limitations

The following guidelines and limitations apply to Webtype access lists:

- The **access-list webtype** command is used to configure clientless SSL VPN filtering. The URL specified may be full or partial (no file specified), may include wildcards for the server, or may specify a port. See the [“Adding Webtype Access Lists with a URL String” section on page 18-3](#) for information about using wildcard characters in the URL string.
- Valid protocol identifiers are http, https, cifs, imap4, pop3, and smtp. The RL may also contain the keyword **any** to refer to any URL. An asterisk may be used to refer to a subcomponent of a DNS name.

Default Settings

[Table 18-1](#) lists the default settings for Webtype access lists parameters.

Table 18-1 *Default Webtype Access List Parameters*

Parameters	Default
deny	The ASA denies all packets on the originating interface unless you specifically permit access.
log	Access list logging generates system log message 106023 for denied packets. Deny packets must be present to log denied packets.

Using Webtype Access Lists

This section includes the following topics:

- [Task Flow for Configuring Webtype Access Lists, page 18-2](#)
- [Adding Webtype Access Lists with a URL String, page 18-3](#)
- [Adding Webtype Access Lists with an IP Address, page 18-4](#)
- [Adding Remarks to Access Lists, page 18-5](#)

Task Flow for Configuring Webtype Access Lists

Use the following guidelines to create and implement an access list:

- Create an access list by adding an ACE and applying an access list name. See the [“Using Webtype Access Lists” section on page 18-2](#).
- Apply the access list to an interface. See the [“Configuring Access Rules” section on page 34-8](#) for more information.

Adding Webtype Access Lists with a URL String

To add an access list to the configuration that supports filtering for clientless SSL VPN, enter the following command:

Command	Purpose
<pre>access-list access_list_name webtype {deny permit} url [url_string any] [log[[disable default] level] interval secs] [time_range name]]</pre> Example: <pre>hostname(config)# access-list acl_company webtype deny url http://*.cisco.example</pre>	Adds an access list to the configuration that supports filtering for WebVPN. The <i>access_list_name</i> argument specifies the name or number of an access list. The any keyword specifies all URLs. The deny keyword denies access if the conditions are matched. The interval option specifies the time interval at which to generate system log message 106100; valid values are from 1 to 600 seconds. The log [[disable default] <i>level</i>] option specifies that system log message 106100 is generated for the ACE. When the log optional keyword is specified, the default level for system log message 106100 is 6 (informational). See the log command for more information. The permit keyword permits access if the conditions are matched. The time_range <i>name</i> option specifies a keyword for attaching the time-range option to this access list element. The url keyword specifies that a URL be used for filtering. The <i>url_string</i> option specifies the URL to be filtered. You can use the following wildcard characters to define more than one wildcard in the Webtype access list entry: • Enter an asterisk “*” to match no characters or any number of characters. • Enter a question mark “?” to match any one character exactly. • Enter square brackets “[]” to create a range operator that matches any one character in a range.  Note To match any http URL, you must enter http://*/* instead of the former method of entering http://*. To remove an access list, use the no form of this command with the complete syntax string as it appears in the configuration.

Adding Webtype Access Lists with an IP Address

To add an access list to the configuration that supports filtering for clientless SSL VPN, enter the following command:

Command	Purpose
<pre>access-list access_list_name webtype {deny permit} tcp [host ip_address ip_address subnet_mask any] [oper port[port]] [log[[disable default] level] interval secs][time_range name]</pre>	Adds an access list to the configuration that supports filtering for WebVPN. The <i>access_list_name</i> argument specifies the name or number of an access list. The any keyword specifies all IP addresses. The deny keyword denies access if the conditions are matched. The host ip_address option specifies a host IP address. The interval option specifies the time interval at which to generate system log message 106100; valid values are from 1 to 600 seconds. The <i>ip_address ip_mask</i> option specifies a specific IP address and subnet mask. The log [[disable default] level] option specifies that system log message 106100 is generated for the ACE. When the log optional keyword is specified, the default level for system log message 106100 is 6 (informational). See the log command for more information. The permit keyword permits access if the conditions are matched. The port option specifies the decimal number or name of a TCP or UDP port. The time_range name option specifies a keyword for attaching the time-range option to this access list element. To remove an access list, use the no form of this command with the complete syntax string as it appears in the configuration.

Example:
hostname(config)# access-list acl_company
webtype permit tcp any

Adding Remarks to Access Lists

You can include remarks about entries in any access list, including extended, EtherType, IPv6, standard, and Webtype access lists. The remarks make the access list easier to understand.

To add a remark after the last **access-list** command you entered, enter the following command:

Command	Purpose
access-list <i>access_list_name</i> remark <i>text</i>	Adds a remark after the last access-list command you entered.
Example: hostname(config)# access-list OUT remark - this is the inside admin address	The text can be up to 100 characters in length. You can enter leading spaces at the beginning of the text. Trailing spaces are ignored. If you enter the remark before any access-list command, then the remark is the first line in the access list. If you delete an access list using the no access-list <i>access_list_name</i> command, then all the remarks are also removed.

Example

You can add a remark before each ACE, and the remarks appear in the access list in these locations. Entering a dash (-) at the beginning of a remark helps set it apart from an ACE.

```
hostname(config)# access-list OUT remark - this is the inside admin address
hostname(config)# access-list OUT extended permit ip host 209.168.200.3 any
hostname(config)# access-list OUT remark - this is the hr admin address
hostname(config)# access-list OUT extended permit ip host 209.168.200.4 any
```

What to Do Next

Apply the access list to an interface. See the [“Configuring Access Rules” section on page 34-8](#) for more information.

Monitoring Webtype Access Lists

To monitor webtype access lists, enter the following command:

Command	Purpose
show running-config access list	Displays the access-list configuration running on the ASA.

Configuration Examples for Webtype Access Lists

The following example shows how to deny access to a specific company URL:

```
hostname(config)# access-list acl_company webtype deny url http://*.example.com
```

The following example shows how to deny access to a specific file:

```
hostname(config)# access-list acl_file webtype deny url
https://www.example.com/dir/file.html
```

The following example shows how to deny HTTP access to any URL through port 8080:

```
hostname(config)# access-list acl_company webtype deny url http://my-server:8080/*
```

The following examples show how to use wildcards in Webtype access lists.

- The following example matches URLs such as <http://www.example.com/> and <http://www.example.net/>:

```
access-list test webtype permit url http://www.*example/
```
- The following example matches URLs such as <http://www.cisco.com> and <ftp://wwwz.example.com>:

```
access-list test webtype permit url *://ww?.c*co*/
```
- The following example matches URLs such as <http://www.cisco.com:80> and <https://www.cisco.com:81>:

```
access-list test webtype permit url *://ww?.c*co*:8[01]/
```

The range operator “[]” in the preceding example specifies that either character **0** or **1** can occur.

- The following example matches URLs such as <http://www.example.com> and <http://www.example.net>:

```
access-list test webtype permit url http://www.[a-z]ample?*/
```

The range operator “[]” in the preceding example specifies that any character in the range from **a** to **z** can occur.

- The following example matches URLs such as <http://www.cisco.com/anything/crazy/url/ddtscgiz>:

```
access-list test webtype permit url htt*://*/cgi?*
```

Note

To match any http URL, you must enter **http://*/*** instead of the former method of entering **http://***.

The following example shows how to enforce a webtype access list to disable access to specific CIFS shares.

In this scenario we have a root folder named “shares” that contains two sub-folders named “Marketing_Reports” and “Sales_Reports.” We want to specifically deny access to the “shares/Marketing_Reports” folder.

```
access-list CIFS_Avoid webtype deny url cifs://172.16.10.40/shares/Marketing_Reports.
```

However, due to the implicit “deny all,” the above access list makes all of the sub-folders inaccessible (“shares/Sales_Reports” and “shares/Marketing_Reports”), including the root folder (“shares”).

To fix the problem, add a new access list to allow access to the root folder and the remaining sub-folders:

```
access-list CIFS_Allow webtype permit url cifs://172.16.10.40/shares*
```

Feature History for Webtype Access Lists

Table 18-2 lists the release history for this feature.

Table 18-2 *Feature History for Webtype Access Lists*

Feature Name	Releases	Feature Information
Webtype access lists	7.0(1)	Webtype access lists are access lists that are added to a configuration that supports filtering for clientless SSL VPN. We introduced the feature and the following command: access-list webtype.

CHAPTER 19

Adding an IPv6 Access List

This chapter describes how to configure IPv6 access lists to control and filter traffic through the ASA.

This chapter includes the following sections:

- [Information About IPv6 Access Lists, page 19-1](#)
- [Licensing Requirements for IPv6 Access Lists, page 19-1](#)
- [Prerequisites for Adding IPv6 Access Lists, page 19-2](#)
- [Guidelines and Limitations, page 19-2](#)
- [Default Settings, page 19-3](#)
- [Configuring IPv6 Access Lists, page 19-4](#)
- [Monitoring IPv6 Access Lists, page 19-7](#)
- [Configuration Examples for IPv6 Access Lists, page 19-7](#)
- [Where to Go Next, page 19-7](#)
- [Feature History for IPv6 Access Lists, page 19-7](#)

Information About IPv6 Access Lists

The typical access list functionality in IPv6 is similar to access lists in IPv4. Access lists determine which traffic to block and which traffic to forward at router interfaces. Access lists allow filtering based upon source and destination addresses, inbound and outbound to specific interfaces. Each access list has an implicit deny statement at the end. You define IPv6 access lists and set their deny and permit conditions using the **ipv6 access-list** command with the **deny** and **permit** keywords in global configuration mode.

Licensing Requirements for IPv6 Access Lists

The following table shows the licensing requirements for this feature:

Model	License Requirement
All models	Base License.

Prerequisites for Adding IPv6 Access Lists

You should be familiar with IPv6 addressing and basic configuration. See the **ipv6** commands in the *Cisco Security Appliance Command Reference* for more information about configuring IPv6.

Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

Context Mode Guidelines

Supported in single and multiple context modes.

Firewall Mode Guidelines

Supported in routed and transparent firewall modes.

IPv6 Guidelines

Supports IPv6.

Additional Guidelines and Limitations

The following guidelines and limitations apply to IPv6 access lists:

- The **ipv6 access-list** command allows you to specify whether an IPv6 address is permitted or denied access to a port or protocol. Each command is called an ACE. One or more ACEs with the same access list name are referred to as an access list. Apply an access list to an interface using the **access-group** command.
- The ASA denies all packets from an outside interface to an inside interface unless you specifically permit access using an access list. All packets are allowed by default from an inside interface to an outside interface unless you specifically deny access.
- The **ipv6 access-list** command is similar to the **access-list** command, except that it is IPv6-specific. For additional information about access lists, refer to the **access-list extended** command.
- The **ipv6 access-list icmp** command is used to filter ICMPv6 messages that pass through the ASA. To configure the ICMPv6 traffic that is allowed to originate and terminate at a specific interface, use the **ipv6 icmp** command.
- See the **object-group** command for information on how to configure object groups.
- Possible operands for the operator option of the **ipv6 access-list** command include **lt** for less than, **gt** for greater than, **eq** for equal to, **neq** for not equal to, and **range** for an inclusive range. Use the **ipv6 access-list** command without an operator and port to indicate all ports by default.
- ICMP message types are filtered by the access rule. Omitting the *icmp_type* argument indicates all ICMP types. If you specify ICMP types, the value can be a valid ICMP type number (from 0 to 255) or one of the following ICMP type literals:
 - destination-unreachable
 - packet-too-big
 - time-exceeded
 - parameter-problem
 - echo-request

- echo-reply
 - membership-query
 - membership-report
 - membership-reduction
 - router-renumbering
 - router-solicitation
 - router-advertisement
 - neighbor-solicitation
 - neighbor-advertisement
 - neighbor-redirect
- If the protocol argument is specified, valid values are **icmp**, **ip**, **tcp**, **udp**, or an integer in the range of 1 to 254, representing an IP protocol number.

| Default Settings

Table 19-1 lists the default settings for IPv6 access list parameters.

Table 19-1 **Default IPv6 Access List Parameters**

Parameters	Default
default	The default option specifies that a syslog message 106100 is generated for the ACE.
interval <i>secs</i>	Specifies the time interval at which to generate a 106100 syslog message; valid values are from 1 to 600 seconds. The default interval is 300 seconds. This value is also used as the timeout value for deleting an inactive flow.
<i>level</i>	The <i>level</i> option specifies the syslog level for message 106100; valid values are from 0 to 7. The default level is 6 (informational).
log	The log option specifies logging action for the ACE. If you do not specify the log keyword or you specify the log default keyword, then message 106023 is generated when a packet is denied by the ACE. If you specify the log keyword alone or with a level or interval, then message 106100 is generated when a packet is denied by the ACE. Packets that are denied by the implicit deny at the end of an access list are not logged. You must implicitly deny packets with an ACE to enable logging.

Configuring IPv6 Access Lists

This section includes the following topics:

- [Task Flow for Configuring IPv6 Access Lists, page 19-4](#)
- [Adding IPv6 Access Lists, page 19-5](#)
- [Adding Remarks to Access Lists, page 19-6](#)

Task Flow for Configuring IPv6 Access Lists

Use the following guidelines to create and implement an access list:

- Create an access list by adding an ACE and applying an access list name, as shown in the [“Adding IPv6 Access Lists” section on page 19-5](#).
- Apply the access list to an interface. (See the [“Configuring Access Rules” section on page 34-8](#) for more information.)

Adding IPv6 Access Lists

You can add a regular IPv6 access list or add an IPv6 access list with TCP.

To add a regular IPv6 access list, enter the following command:

Command	Purpose
<pre> ipv6 access-list <i>id</i> [line <i>line-num</i>] {deny permit} {<i>protocol</i> object-group <i>protocol_obj_grp_id</i> {<i>source-ipv6-prefix/prefix-length</i> any host <i>source-ipv6-address</i> object-group <i>network_obj_grp_id</i>} [<i>operator</i> {<i>port</i> [<i>port</i>] object-group <i>service_obj_grp_id</i>}] {<i>destination-ipv6-prefix/prefix-length</i> any host <i>destination-ipv6-address</i> object-group <i>network_obj_grp_id</i> [<i>{operator port [port] object-group</i> <i>service_obj_grp_id</i>}] [log [<i>level</i>] [<i>interval secs</i>] disable default]] </pre>	Configures an IPv6 access list. The any keyword is an abbreviation for the IPv6 prefix <code>::/0</code>, indicating any IPv6 address. The deny keyword denies access if the conditions are matched. The <i>destination-ipv6-address</i> argument identifies the IPv6 address of the host receiving the traffic. The <i>destination-ipv6-prefix</i> argument identifies the IPv6 network address where the traffic is destined. The disable option disables syslog messaging. The host keyword indicates that the address refers to a specific host. The <i>id</i> keyword specifies the number of an access list. The <i>line line-num</i> option specifies the line number for inserting the access rule into the list. By default, the ACE is added to the end of the access list. The <i>network_obj_grp_id</i> argument specifies existing network object group identification. The object-group option specifies an object group. The <i>operator</i> option compares the source IP address or destination IP address ports. For a list of permitted operands, see the “Guidelines and Limitations” section on page 19-2. The permit keyword permits access if the conditions are matched. The <i>port</i> option specifies the port that you permit or deny access. You can specify the port either by a number in the range of 0 to 65535 or by a literal name if the protocol is tcp or udp. For a list of permitted TCP or UDP literal names, see the “Guidelines and Limitations” section on page 19-2. The <i>prefix-length</i> argument indicates how many of the high-order, contiguous bits of the address comprise the IPv6 prefix. The <i>protocol</i> argument specifies the name or number of an IP protocol. The <i>protocol_obj_grp_id</i> indicates the existing protocol object group ID. The <i>service_obj_grp_id</i> option specifies the object group. The <i>source-ipv6-address</i> specifies the address of the host sending traffic. The <i>source-ipv6-prefix</i> specifies the IPv6 address of traffic origin.

Example:

```

hostname(config)# ipv6 access-list acl_grp
permit tcp any host
3001:1::203:A0FF:FED6:162D

```

To configure an IPv6 access list with ICMP, enter the following command:

Command	Purpose
<pre>ipv6 access-list id [line line-num] {deny permit} icmp6 {source-ipv6-prefix/prefix-length any host source-ipv6-address object-group network_obj_grp_id} {destination-ipv6-prefix/prefix-length any host destination-ipv6-address object-group network_obj_grp_id} [icmp_type object-group icmp_type_obj_grp_id] [log [[level]] [interval secs] disable default]]</pre>	Configures an IPv6 access list with ICMP. The icmp6 keyword specifies that the access rule applies to ICMPv6 traffic passing through the ASA. The <i>icmp_type</i> argument specifies the ICMP message type being filtered by the access rule. The value can be a valid ICMP type number from 0 to 255. (For a list of the permitted ICMP type literals, see the “Guidelines and Limitations” section on page 19-2.) The <i>icmp_type_obj_grp_id</i> option specifies the object group ICMP type ID. For details about additional ipv6 access-list command parameters, see the preceding procedure for adding a regular IPv6 access list, or see the ipv6 access-list command in the <i>Cisco Security Appliance Command Reference</i>.
Example: <pre>hostname(config)# ipv6 access list acl_grp permit tcp host 3001:1::203:A0FF:FED6:162D</pre>	

Adding Remarks to Access Lists

You can include remarks about entries in any access list, including extended, EtherType, IPv6, standard, and Webtype access lists. The remarks make the access list easier to understand.

To add a remark after the last **access-list** command you entered, enter the following command:

Command	Purpose
<pre>access-list access_list_name remark text</pre>	Adds a remark after the last access-list command you entered. The text can be up to 100 characters in length. You can enter leading spaces at the beginning of the text. Trailing spaces are ignored.
Example: <pre>hostname(config)# access-list OUT remark - this is the inside admin address</pre>	If you enter the remark before any access-list command, then the remark is the first line in the access list. If you delete an access list using the no access-list access_list_name command, then all the remarks are also removed.

Example

You can add remarks before each ACE, and the remarks appear in the access list in these locations. Entering a dash (-) at the beginning of a remark helps set it apart from an ACE.

```
hostname(config)# access-list OUT remark - this is the inside admin address
hostname(config)# access-list OUT extended permit ip host 209.168.200.3 any
hostname(config)# access-list OUT remark - this is the hr admin address
hostname(config)# access-list OUT extended permit ip host 209.168.200.4 any
```

Monitoring IPv6 Access Lists

To monitor IPv6 access lists, perform one of the following tasks:

Command	Purpose
<code>show ipv6 access-list</code>	Displays all IPv6 access list information.

Configuration Examples for IPv6 Access Lists

The following example shows how to configure IPv6 access lists:

The following example allows any host using TCP to access the 3001:1::203:A0FF:FED6:162D server:

```
hostname(config)# ipv6 access-list acl_grp permit tcp any host 3001:1::203:A0FF:FED6:162D
```

The following example uses **eq** and a port to deny access to just FTP:

```
hostname(config)# ipv6 access-list acl_out deny tcp any host 3001:1::203:A0FF:FED6:162D eq ftp
hostname(config)# access-group acl_out in interface inside
```

The following example uses **lt** to permit access to all ports less than port 2025, which permits access to the well-known ports (1 to 1024):

```
hostname(config)# ipv6 access-list acl_dmz1 permit tcp any host 3001:1::203:A0FF:FED6:162D lt 1025
hostname(config)# access-group acl_dmz1 in interface dmz1
```

Where to Go Next

Apply the access list to an interface. (See the [“Configuring Access Rules”](#) section on page 34-8 for more information.)

Feature History for IPv6 Access Lists

Table 19-2 lists the release history for this feature.

Table 19-2 Feature History for IPv6 Access Lists

Feature Name	Releases	Feature Information
IPv6 access lists	7.0(1)	We introduced the following command: ipv6 access-list .

CHAPTER 20

Configuring Logging for Access Lists

This chapter describes how to configure access list logging for extended access lists and Webtype access lists, and it describes how to manage deny flows.

This chapter includes the following sections:

- [Configuring Logging for Access Lists, page 20-1](#)
- [Managing Deny Flows, page 20-5](#)

Configuring Logging for Access Lists

This section includes the following topics:

- [Information About Logging Access List Activity, page 20-1](#)
- [Licensing Requirements for Access List Logging, page 20-2](#)
- [Guidelines and Limitations, page 20-2](#)
- [Default Settings, page 20-3](#)
- [Configuring Access List Logging, page 20-3](#)
- [Monitoring Access Lists, page 20-4](#)
- [Configuration Examples for Access List Logging, page 20-4](#)
- [Feature History for Access List Logging, page 20-5](#)

Information About Logging Access List Activity

By default, when traffic is denied by an extended ACE or a Webtype ACE, the ASA generates syslog message 106023 for each denied packet in the following form:

```
%ASA|PIX-4-106023: Deny protocol src [interface_name:source_address/source_port] dst  
interface_name:dest_address/dest_port [type {string}, code {code}] by access_group acl_id
```

If the ASA is attacked, the number of syslog messages for denied packets can be very large. We recommend that you instead enable logging using syslog message 106100, which provides statistics for each ACE and enables you to limit the number of syslog messages produced. Alternatively, you can disable all logging.

Note

Only ACEs in the access list generate logging messages; the implicit deny at the end of the access list does not generate a message. If you want all denied traffic to generate messages, add the implicit ACE manually to the end of the access list, as shown in the following example:

```
hostname(config)# access-list TEST deny ip any any log
```

The **log** options at the end of the extended **access-list** command enable you to set the following behavior:

- Enable message 106100 instead of message 106023
- Disable all logging
- Return to the default logging using message 106023

Syslog message 106100 uses the following form:

```
%ASA|PIX-n-106100: access-list acl_id {permitted | denied} protocol  
interface_name/source_address(source_port) -> interface_name/dest_address(dest_port)  
hit-cnt number ({first hit | number-second interval})
```

When you enable logging for message 106100, if a packet matches an ACE, the ASA creates a flow entry to track the number of packets received within a specific interval. The ASA generates a syslog message at the first hit and at the end of each interval, identifying the total number of hits during the interval and the timestamp for the last hit. At the end of each interval, the ASA resets the hit count to 0. If no packets match the ACE during an interval, the ASA deletes the flow entry.

A flow is defined by the source and destination IP addresses, protocols, and ports. Because the source port might differ for a new connection between the same two hosts, you might not see the same flow increment because a new flow was created for the connection. See the [“Managing Deny Flows” section on page 20-5](#) to limit the number of logging flows.

Permitted packets that belong to established connections do not need to be checked against access lists; only the initial packet is logged and included in the hit count. For connectionless protocols, such as ICMP, all packets are logged, even if they are permitted, and all denied packets are logged.

See the *Cisco ASA 5500 Series System Log Messages* guide for detailed information about this syslog message.

Licensing Requirements for Access List Logging

The following table shows the licensing requirements for this feature:

Model	License Requirement
All models	Base License.

Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

Context Mode Guidelines

Supported in single and multiple context mode.

Firewall Mode Guidelines

Supported only in routed and transparent firewall modes.

IPv6 Guidelines

Supports IPv6.

Additional Guidelines and Limitations

ACE logging generates syslog message 106023 for denied packets. A deny ACE must be present to log denied packets.

Default Settings

Table 20-1 lists the default settings for extended access list parameters.

Table 20-1 Default Extended Access List Parameters

Parameters	Default
log	When the log keyword is specified, the default level for syslog message 106100 is 6 (informational), and the default interval is 300 seconds.

Configuring Access List Logging

This sections describes how to configure access list logging.

**Note**

For complete access list command syntax, see the [“Configuring Extended Access Lists”](#) section on page 15-3 and the [“Using Webtype Access Lists”](#) section on page 18-2.

To configure logging for an ACE, enter the following command:

Command	Purpose
access-list <i>access_list_name</i> [extended] { deny / permit }...[log [[<i>level</i>] [<i>interval secs</i>] disable default]] Example: <pre>hostname(config)# access-list outside-acl permit ip host 1.1.1.1 any log 7 interval 600</pre>	Configures logging for an ACE. The access-list <i>access_list_name</i> syntax specifies the access list for which you want to configure logging. The extended option adds an ACE. The deny keyword denies a packet if the conditions are matched. Some features do not allow deny ACEs, such as NAT. (See the command documentation for each feature that uses an access list for more information.) The permit keyword permits a packet if the conditions are matched. If you enter the log option without any arguments, you enable syslog message 106100 at the default level (6) and for the default interval (300 seconds). See the following options: <i>level</i>—A severity level between 0 and 7. The default is 6. interval secs—The time interval in seconds between syslog messages, from 1 to 600. The default is 300. This value is also used as the timeout value for deleting an inactive flow. disable—Disables all access list logging. default—Enables logging to message 106023. This setting is the same as having no log option. (See the access-list command in the <i>Cisco Security Appliance Command Reference</i> for more information about command options.)

Monitoring Access Lists

To monitor access lists, enter one of the following commands:

Command	Purpose
show access list	Displays the access list entries by number.
show running-config access-list	Displays the current running access list configuration.

Configuration Examples for Access List Logging

This section includes sample configurations for logging access lists.

You might configure the following access list:

```
hostname(config)# access-list outside-acl permit ip host 1.1.1.1 any log 7 interval 600
hostname(config)# access-list outside-acl permit ip host 2.2.2.2 any
hostname(config)# access-list outside-acl deny ip any any log 2
hostname(config)# access-group outside-acl in interface outside
```

When the first ACE of outside-acl permits a packet, the ASA generates the following syslog message:

```
%ASA|PIX-7-106100: access-list outside-acl permitted tcp outside/1.1.1.1(12345) ->
inside/192.168.1.1(1357) hit-cnt 1 (first hit)
```

Although 20 additional packets for this connection arrive on the outside interface, the traffic does not have to be checked against the access list, and the hit count does not increase.

If one or more connections by the same host are initiated within the specified 10-minute interval (and the source and destination ports remain the same), then the hit count is incremented by 1, and the following syslog message displays at the end of the 10-minute interval:

```
%ASA|PIX-7-106100: access-list outside-acl permitted tcp outside/1.1.1.1(12345)->
inside/192.168.1.1(1357) hit-cnt 2 (600-second interval)
```

When the third ACE denies a packet, the ASA generates the following syslog message:

```
%ASA|PIX-2-106100: access-list outside-acl denied ip outside/3.3.3.3(12345) ->
inside/192.168.1.1(1357) hit-cnt 1 (first hit)
```

If 20 additional attempts occur within a 5-minute interval (the default), the following syslog message appears at the end of 5 minutes:

```
%ASA|PIX-2-106100: access-list outside-acl denied ip outside/3.3.3.3(12345) ->
inside/192.168.1.1(1357) hit-cnt 21 (300-second interval)
```

Feature History for Access List Logging

Table 20-2 lists the release history for this feature.

Table 20-2 Feature History for Access List Logging

Feature Name	Releases	Feature Information
Access list logging	7.0(1)	You can enable logging using syslog message 106100, which provides statistics for each ACE and lets you limit the number of syslog messages produced. We introduced the following command: access-list .
ACL Timestamp	8.3(1)	The ASA reports the timestamp for the last access rule hit.

Managing Deny Flows

This section includes the following topics:

- [Information About Managing Deny Flows, page 20-6](#)
- [Licensing Requirements for Managing Deny Flows, page 20-6](#)
- [Guidelines and Limitations, page 20-6](#)
- [Managing Deny Flows, page 20-7](#)
- [Monitoring Deny Flows, page 20-7](#)
- [Feature History for Managing Deny Flows, page 20-8](#)

Information About Managing Deny Flows

When you enable logging for message 106100, if a packet matches an ACE, the ASA creates a flow entry to track the number of packets received within a specific interval. The ASA has a maximum of 32 K logging flows for ACEs. A large number of flows can exist concurrently at any point of time. To prevent unlimited consumption of memory and CPU resources, the ASA places a limit on the number of concurrent *deny* flows; the limit is placed on deny flows only (not on permit flows) because they can indicate an attack. When the limit is reached, the ASA does not create a new deny flow for logging until the existing flows expire.

For example, if someone initiates a DoS attack, the ASA can create a large number of deny flows in a short period of time. Restricting the number of deny flows prevents unlimited consumption of memory and CPU resources.

When you reach the maximum number of deny flows, the ASA issues syslog message 106100:

```
%ASA|PIX-1-106101: The number of ACL log deny-flows has reached limit (number).
```

The **access-list alert-interval** command sets the time interval for generating syslog message 106001. Syslog message 106001 alerts you that the ASA has reached a deny flow maximum. When the deny flow maximum is reached, another syslog message 106001 is generated if at least six seconds have passed since the last 106001 message was generated.

Licensing Requirements for Managing Deny Flows

The following table shows the licensing requirements for this feature:

Model	License Requirement
All models	Base License.

Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

Context Mode Guidelines

Supported in single and multiple context mode.

Firewall Mode Guidelines

Supported only in routed and transparent firewall modes.

IPv6 Guidelines

Supports IPv6.

Additional Guidelines and Limitations

The ASA places a limit on the number of concurrent *deny* flows only—not permit flows.

Default Settings

Table 20-1 lists the default settings for managing deny flows.

Table 20-3 Default Parameters for Managing Deny Flows

Parameters	Default
<i>numbers</i>	The <i>numbers</i> argument specifies the maximum number of deny flows. The default is 4096.
<i>secs</i>	The <i>secs</i> argument specifies the time, in seconds, between syslog messages. The default is 300.

Managing Deny Flows

To configure the maximum number of deny flows and to set the interval between deny flow alert messages (106100), enter the following command:

Command	Purpose
access-list deny-flow-max <i>number</i>	Sets the maximum number of deny flows.
Example: hostname(config)# access-list deny-flow-max 3000	The <i>numbers</i> argument specifies the maximum number, which can be between 1 and 4096. The default is 4096.

To set the amount of time between syslog messages (number 106101), which identifies that the maximum number of deny flows was reached, enter the following command:

Command	Purpose
access-list alert-interval <i>secs</i>	Sets the time, in seconds, between syslog messages.
Example: hostname(config)# access-list alert-interval 200	The <i>secs</i> argument specifies the time interval between each deny flow maximum message. Valid values are from 1 to 3600 seconds. The default is 300 seconds.

Monitoring Deny Flows

To monitor access lists, enter one of the following commands:

Command	Purpose
show access-list	Displays access list entries by number.
show running-config access-list	Displays the current running access list configuration.

Feature History for Managing Deny Flows

Table 20-2 lists the release history for this feature.

Table 20-4 Feature History for Managing Deny Flows

Feature Name	Releases	Feature Information
Managing Deny Flows	7.0(1)	You can configure the maximum number of deny flows and set the interval between deny flow alert messages. We introduced the following commands: access-list deny-flow and access-list alert-interval.

PART 6

Configuring IP Routing

CHAPTER 21

Routing Overview

This chapter describes underlying concepts of how routing behaves within the ASA, and the routing protocols that are supported.

The chapter includes the following sections:

- [Information About Routing, page 21-1](#)
- [How Routing Behaves Within the ASA, page 21-4](#)
- [Supported Internet Protocols for Routing, page 21-5](#)
- [Information About the Routing Table, page 21-6](#)
- [Information About IPv6 Support, page 21-9](#)
- [Disabling Proxy ARPs, page 21-11](#)

Information About Routing

Routing is the act of moving information across an internetwork from a source to a destination. Along the way, at least one intermediate node typically is encountered. Routing involves two basic activities: determining optimal routing paths and transporting information groups (typically called packets) through an internetwork. In the context of the routing process, the latter of these is referred to as packet switching. Although packet switching is relatively straightforward, path determination can be very complex.

This section includes the following topics:

- [Switching, page 21-2](#)
- [Path Determination, page 21-2](#)
- [Supported Route Types, page 21-2](#)

Switching

Switching algorithms is relatively simple; it is the same for most routing protocols. In most cases, a host determines that it must send a packet to another host. Having acquired a router address by some means, the source host sends a packet addressed specifically to a router physical (Media Access Control [MAC]-layer) address, this time with the protocol (network layer) address of the destination host.

As it examines the packet destination protocol address, the router determines that it either knows or does not know how to forward the packet to the next hop. If the router does not know how to forward the packet, it typically drops the packet. If the router knows how to forward the packet, however, it changes the destination physical address to that of the next hop and transmits the packet.

The next hop may be the ultimate destination host. If not, the next hop is usually another router, which executes the same switching decision process. As the packet moves through the internetwork, its physical address changes, but its protocol address remains constant.

Path Determination

Routing protocols use metrics to evaluate what path will be the best for a packet to travel. A metric is a standard of measurement, such as path bandwidth, that is used by routing algorithms to determine the optimal path to a destination. To aid the process of path determination, routing algorithms initialize and maintain routing tables, which include route information. Route information varies depending on the routing algorithm used.

Routing algorithms fill routing tables with a variety of information. Destination or next hop associations tell a router that a particular destination can be reached optimally by sending the packet to a particular router representing the next hop on the way to the final destination. When a router receives an incoming packet, it checks the destination address and attempts to associate this address with a next hop.

Routing tables also can include other information, such as data about the desirability of a path. Routers compare metrics to determine optimal routes, and these metrics differ depending on the design of the routing algorithm used.

Routers communicate with one another and maintain their routing tables through the transmission of a variety of messages. The routing update message is one such message that generally consists of all or a portion of a routing table. By analyzing routing updates from all other routers, a router can build a detailed picture of network topology. A link-state advertisement, another example of a message sent between routers, informs other routers of the state of the sender links. Link information also can be used to build a complete picture of network topology to enable routers to determine optimal routes to network destinations.

**Note**

Asymmetric routing is only supported for Active/Active failover in multiple context mode. For more information, see the [“Configuring Active/Active Failover”](#) section on page 62-8.

Supported Route Types

There are several types of route types that a router can use. The ASA uses the following route types:

- [Static Versus Dynamic](#), page 21-3
- [Single-Path Versus Multipath](#), page 21-3
- [Flat Versus Hierarchical](#), page 21-3

- [Link-State Versus Distance Vector, page 21-4](#)

Static Versus Dynamic

Static routing algorithms are hardly algorithms at all, but are table mappings established by the network administrator before the beginning of routing. These mappings do not change unless the network administrator alters them. Algorithms that use static routes are simple to design and work well in environments where network traffic is relatively predictable and where network design is relatively simple.

Because static routing systems cannot react to network changes, they generally are considered unsuitable for large, constantly changing networks. Most of the dominant routing algorithms are dynamic routing algorithms, which adjust to changing network circumstances by analyzing incoming routing update messages. If the message indicates that a network change has occurred, the routing software recalculates routes and sends out new routing update messages. These messages permeate the network, stimulating routers to rerun their algorithms and change their routing tables accordingly.

Dynamic routing algorithms can be supplemented with static routes where appropriate. A router of last resort (a router to which all unroutable packets are sent), for example, can be designated to act as a repository for all unroutable packets, ensuring that all messages are at least handled in some way.

**Note**

There is no dynamic routing support in multi-context mode. As a result, there is no route tracking.

Single-Path Versus Multipath

Some sophisticated routing protocols support multiple paths to the same destination. Unlike single-path algorithms, these multipath algorithms permit traffic multiplexing over multiple lines. The advantages of multipath algorithms are substantially better throughput and reliability, which is generally called load sharing.

Flat Versus Hierarchical

Some routing algorithms operate in a flat space, while others use routing hierarchies. In a flat routing system, the routers are peers of all others. In a hierarchical routing system, some routers form what amounts to a routing backbone. Packets from nonbackbone routers travel to the backbone routers, where they are sent through the backbone until they reach the general area of the destination. At this point, they travel from the last backbone router through one or more nonbackbone routers to the final destination.

Routing systems often designate logical groups of nodes, called domains, autonomous systems, or areas. In hierarchical systems, some routers in a domain can communicate with routers in other domains, while others can communicate only with routers within their domain. In very large networks, additional hierarchical levels may exist, with routers at the highest hierarchical level forming the routing backbone.

The primary advantage of hierarchical routing is that it mimics the organization of most companies and therefore supports their traffic patterns well. Most network communication occurs within small company groups (domains). Because intradomain routers need to know only about other routers within their domain, their routing algorithms can be simplified, and, depending on the routing algorithm being used, routing update traffic can be reduced accordingly.

Link-State Versus Distance Vector

Link-state algorithms (also known as shortest path first algorithms) flood routing information to all nodes in the internetwork. Each router, however, sends only the portion of the routing table that describes the state of its own links. In link-state algorithms, each router builds a picture of the entire network in its routing tables. Distance vector algorithms (also known as Bellman-Ford algorithms) call for each router to send all or some portion of its routing table, but only to its neighbors. In essence, link-state algorithms send small updates everywhere, while distance vector algorithms send larger updates only to neighboring routers. Distance vector algorithms know only about their neighbors. Typically, this type of algorithm is used in conjunction with OSPF routing protocols.

How Routing Behaves Within the ASA

The ASA uses both routing table and XLATE tables for routing decisions. To handle destination IP translated traffic, that is, untranslated traffic, the ASA searches for existing XLATE, or static translation to select the egress interface.

This section includes the following topics:

- [Egress Interface Selection Process, page 21-4](#)
- [Next Hop Selection Process, page 21-4](#)

Egress Interface Selection Process

The selection process follows these steps:

1. If a destination IP translating XLATE already exists, the egress interface for the packet is determined from the XLATE table, but not from the routing table.
2. If a destination IP translating XLATE does not exist, but a matching static translation exists, then the egress interface is determined from the static route and an XLATE is created, and the routing table is not used.
3. If a destination IP translating XLATE does not exist and no matching static translation exists, the packet is not destination IP translated. The ASA processes this packet by looking up the route to select the egress interface, then source IP translation is performed (if necessary).

For regular dynamic outbound NAT, initial outgoing packets are routed using the route table and then creating the XLATE. Incoming return packets are forwarded using existing XLATE only. For static NAT, destination translated incoming packets are always forwarded using existing XLATE or static translation rules.

Next Hop Selection Process

After selecting the egress interface using any method described previously, an additional route lookup is performed to find out suitable next hop(s) that belong to a previously selected egress interface. If there are no routes in the routing table that explicitly belong to a selected interface, the packet is dropped with

a level 6 syslog message 110001 generated (no route to host), even if there is another route for a given destination network that belongs to a different egress interface. If the route that belongs to a selected egress interface is found, the packet is forwarded to the corresponding next hop.

Load sharing on the ASA is possible only for multiple next hops available using a single egress interface. Load sharing cannot share multiple egress interfaces.

If dynamic routing is in use on the ASA and the route table changes after XLATE creation (for example, route flap), then destination translated traffic is still forwarded using the old XLATE, not via the route table, until XLATE times out. It may be either forwarded to the wrong interface or dropped with a level 6 syslog message 110001 generated (no route to host), if the old route was removed from the old interface and attached to another one by the routing process.

The same problem may happen when there are no route flaps on the ASA itself, but some routing process is flapping around it, sending source-translated packets that belong to the same flow through the ASA using different interfaces. Destination-translated return packets may be forwarded back using the wrong egress interface.

This issue has a high probability in some security traffic configurations, where virtually any traffic may be either source-translated or destination-translated, depending on the direction of the initial packet in the flow. When this issue occurs after a route flap, it can be resolved manually by using the **clear xlate** command, or automatically resolved by an XLATE timeout. The XLATE timeout may be decreased if necessary. To ensure that this issue rarely occurs, make sure that there are no route flaps on the ASA and around it. That is, ensure that destination-translated packets that belong to the same flow are always forwarded the same way through the ASA.

Supported Internet Protocols for Routing

The ASA supports several Internet protocols for routing. Each protocol is briefly described in this section.

- Enhanced Interior Gateway Routing Protocol (EIGRP)

EIGRP provides compatibility and seamless interoperability with IGRP routers. An automatic-redistribution mechanism allows IGRP routes to be imported into Enhanced IGRP, and vice versa, so it is possible to add Enhanced IGRP gradually into an existing IGRP network.

For more information about configuring EIGRP, see the [“Configuring EIGRP” section on page 27-3](#).

- Open Shortest Path First (OSPF)

Open Shortest Path First (OSPF) is a routing protocol developed for Internet Protocol (IP) networks by the interior gateway protocol (IGP) working group of the Internet Engineering Task Force (IETF). OSPF uses a link-state algorithm to build and calculate the shortest path to all known destinations. Each router in an OSPF area includes an identical link-state database, which is a list of each of the router usable interfaces and reachable neighbors.

For more information about configuring OSPF, see the [“Configuring OSPF” section on page 24-3](#).

- Routing Information Protocol

The Routing Information Protocol (RIP) is a distance-vector protocol that uses hop count as its metric. RIP is widely used for routing traffic in the global Internet and is an interior gateway protocol (IGP), which means that it performs routing within a single autonomous system.

For more information about configuring RIP, see the [“Configuring RIP” section on page 25-4](#).

Information About the Routing Table

This section includes the following topics:

- [Displaying the Routing Table, page 21-6](#)
- [How the Routing Table Is Populated, page 21-6](#)
- [How Forwarding Decisions Are Made, page 21-8](#)
- [Dynamic Routing and Failover, page 21-9](#)

Displaying the Routing Table

To view the entries in the routing table, enter the following command:

```
hostname# show route
```

```
Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default, U - per-user static route, o - ODR
       P - periodic downloaded static route
```

```
Gateway of last resort is 10.86.194.1 to network 0.0.0.0
```

```
S    10.1.1.0 255.255.255.0 [3/0] via 10.86.194.1, outside
C    10.86.194.0 255.255.254.0 is directly connected, outside
S*   0.0.0.0 0.0.0.0 [1/0] via 10.86.194.1, outside
```

On the ASA 5505, the following route is also shown. It is the internal loopback interface, which is used by the VPN hardware client feature for individual user authentication.

```
C 127.1.0.0 255.255.0.0 is directly connected, _internal_loopback
```

How the Routing Table Is Populated

The ASA routing table can be populated by statically defined routes, directly connected routes, and routes discovered by the RIP, EIGRP, and OSPF routing protocols. Because the ASA can run multiple routing protocols in addition to having static and connected routes in the routing table, it is possible that the same route is discovered or entered in more than one manner. When two routes to the same destination are put into the routing table, the one that remains in the routing table is determined as follows:

- If the two routes have different network prefix lengths (network masks), then both routes are considered unique and are entered into the routing table. The packet forwarding logic then determines which of the two to use.

For example, if the RIP and OSPF processes discovered the following routes:

- RIP: 192.168.32.0/24
- OSPF: 192.168.32.0/19

Even though OSPF routes have the better administrative distance, both routes are installed in the routing table because each of these routes has a different prefix length (subnet mask). They are considered different destinations and the packet forwarding logic determines which route to use.

- If the ASA learns about multiple paths to the same destination from a single routing protocol, such as RIP, the route with the better metric (as determined by the routing protocol) is entered into the routing table.

Metrics are values associated with specific routes, ranking them from most preferred to least preferred. The parameters used to determine the metrics differ for different routing protocols. The path with the lowest metric is selected as the optimal path and installed in the routing table. If there are multiple paths to the same destination with equal metrics, load balancing is done on these equal cost paths.

- If the ASA learns about a destination from more than one routing protocol, the administrative distances of the routes are compared and the routes with lower administrative distance are entered into the routing table.

You can change the administrative distances for routes discovered by or redistributed into a routing protocol. If two routes from two different routing protocols have the same administrative distance, then the route with the lower *default* administrative distance is entered into the routing table. In the case of EIGRP and OSPF routes, if the EIGRP route and the OSPF route have the same administrative distance, then the EIGRP route is chosen by default.

Administrative distance is a route parameter that the ASA uses to select the best path when there are two or more different routes to the same destination from two different routing protocols. Because the routing protocols have metrics based on algorithms that are different from the other protocols, it is not always possible to determine the best path for two routes to the same destination that were generated by different routing protocols.

Each routing protocol is prioritized using an administrative distance value. [Table 21-1](#) shows the default administrative distance values for the routing protocols supported by the ASA.

Table 21-1 Default Administrative Distance for Supported Routing Protocols

Route Source	Default Administrative Distance
Connected interface	0
Static route	1
EIGRP Summary Route	5
Internal EIGRP	90
OSPF	110
RIP	120
EIGRP external route	170
Unknown	255

The smaller the administrative distance value, the more preference is given to the protocol. For example, if the ASA receives a route to a certain network from both an OSPF routing process (default administrative distance - 110) and a RIP routing process (default administrative distance - 120), the ASA chooses the OSPF route because OSPF has a higher preference. In this case, the router adds the OSPF version of the route to the routing table.

In this example, if the source of the OSPF-derived route was lost (for example, due to a power shutdown), the ASA would then use the RIP-derived route until the OSPF-derived route reappears.

The administrative distance is a local setting. For example, if you use the **distance-ospf** command to change the administrative distance of routes obtained through OSPF, that change would only affect the routing table for the ASA on which the command was entered. The administrative distance is not advertised in routing updates.

Administrative distance does not affect the routing process. The OSPF and RIP routing processes only advertise the routes that have been discovered by the routing process or redistributed into the routing process. For example, the RIP routing process advertises RIP routes, even if routes discovered by the OSPF routing process are used in the ASA routing table.

Backup Routes

A backup route is registered when the initial attempt to install the route in the routing table fails because another route was installed instead. If the route that was installed in the routing table fails, the routing table maintenance process calls each routing protocol process that has registered a backup route and requests them to reinstall the route in the routing table. If there are multiple protocols with registered backup routes for the failed route, the preferred route is chosen based on administrative distance.

Because of this process, you can create floating static routes that are installed in the routing table when the route discovered by a dynamic routing protocol fails. A floating static route is simply a static route configured with a greater administrative distance than the dynamic routing protocols running on the ASA. When the corresponding route discovered by a dynamic routing process fails, the static route is installed in the routing table.

How Forwarding Decisions Are Made

Forwarding decisions are made as follows:

- If the destination does not match an entry in the routing table, the packet is forwarded through the interface specified for the default route. If a default route has not been configured, the packet is discarded.
- If the destination matches a single entry in the routing table, the packet is forwarded through the interface associated with that route.
- If the destination matches more than one entry in the routing table, and the entries all have the same network prefix length, the packets for that destination are distributed among the interfaces associated with that route.
- If the destination matches more than one entry in the routing table, and the entries have different network prefix lengths, then the packet is forwarded out of the interface associated with the route that has the longer network prefix length.

For example, a packet destined for 192.168.32.1 arrives on an interface of an ASA with the following routes in the routing table:

```
hostname# show route
....
R   192.168.32.0/24 [120/4] via 10.1.1.2
O   192.168.32.0/19 [110/229840] via 10.1.1.3
....
```

In this case, a packet destined to 192.168.32.1 is directed toward 10.1.1.2, because 192.168.32.1 falls within the 192.168.32.0/24 network. It also falls within the other route in the routing table, but the 192.168.32.0/24 has the longest prefix within the routing table (24 bits versus 19 bits). Longer prefixes are always preferred over shorter ones when forwarding a packet.

Dynamic Routing and Failover

Because static routing systems cannot react to network changes, they generally are considered unsuitable for large, constantly changing networks. Most of the dominant routing algorithms are dynamic routing algorithms, which adjust to changing network circumstances by analyzing incoming routing update messages. If the message indicates that a network change has occurred, the routing software recalculates routes and sends out new routing update messages. These messages permeate the network, stimulating routers to rerun their algorithms and change their routing tables accordingly.

Dynamic routing algorithms can be supplemented with static routes where appropriate. A router of last resort (a router to which all unroutable packets are sent), for example, can be designated to act as a repository for all unroutable packets, ensuring that all messages are at least handled in some way.

Dynamic routes are synchronized on the standby unit when the routing table changes on the active unit, which means that all additions, deletions, or changes on the active unit are immediately propagated to the standby unit. If the standby unit becomes active after the primary unit has been active for a period of time, routes become synchronized as a part of the failover bulk synchronization process, so the routing table on the active/standby failover pair should appear the same.

For more information about static routes and how to configure them, see the [“Configuring Static and Default Routes”](#) section on page 22-2.

Information About IPv6 Support

Many, but not all, features on the ASA support IPv6 traffic. This section describes the commands and features that support IPv6, and includes the following topics:

- [Features That Support IPv6](#), page 21-9
- [IPv6-Enabled Commands](#), page 21-10
- [Entering IPv6 Addresses in Commands](#), page 21-11

Features That Support IPv6

The following features support IPv6:

Note

For features that use the Modular Policy Framework, be sure to use the **match any** command to match IPv6 traffic; other **match** commands do not support IPv6.

- The following application inspections support IPv6 traffic:
 - FTP
 - HTTP
 - ICMP
 - SIP
 - SMTP
 - IPsec-pass-thru
- IPS

- NetFlow Secure Event Logging filtering
- Connection limits, timeouts, and TCP randomization
- TCP Normalization
- TCP state bypass
- Access group, using an IPv6 access list
- Static Routes
- VPN (all types)
- Failover
- Transparent firewall mode

IPv6-Enabled Commands

The following ASA commands can accept and display IPv6 addresses:

- **capture**
- **configure**
- **copy**
- **failover interface ip**
- **http**
- **name**
- **object-group**
- **ping**
- **show conn**
- **show local-host**
- **show tcpstat**
- **ssh**
- **telnet**
- **tftp-server**
- **who**
- **write**

The following commands were modified to work for IPv6:

- **debug**
- **fragment**
- **ip verify**
- **mtu**
- **icmp** (entered as **ipv6 icmp**)

Entering IPv6 Addresses in Commands

When entering IPv6 addresses in commands that support them, enter the IPv6 address using standard IPv6 notation, for example:

```
ping fe80::2e0:b6ff:fe01:3b7a.
```

The ASA correctly recognizes and processes the IPv6 address. However, you must enclose the IPv6 address in square brackets ([]) in the following situations:

- You need to specify a port number with the address, for example:
- The command uses a colon as a separator, such as the **write net** command and **config net** command, for example:

```
[fe80::2e0:b6ff:fe01:3b7a]:8080.
```

```
configure net [fe80::2e0:b6ff:fe01:3b7a]:/tftp/config/asaconfig.
```

Disabling Proxy ARPs

When a host sends IP traffic to another device on the same Ethernet network, the host needs to know the MAC address of the device. ARP is a Layer 2 protocol that resolves an IP address to a MAC address. A host sends an ARP request asking “Who is this IP address?” The device owning the IP address replies, “I own that IP address; here is my MAC address.”

Proxy ARP is used when a device responds to an ARP request with its own MAC address, even though the device does not own the IP address. The ASA uses proxy ARP when you configure NAT and specify a mapped address that is on the same network as the ASA interface. The only way traffic can reach the hosts is if the ASA uses proxy ARP to claim that the MAC address is assigned to destination mapped addresses.

Under rare circumstances, you might want to disable proxy ARP for NAT addresses.

If you have a VPN client address pool that overlaps with an existing network, the ASA by default sends proxy ARPs on all interfaces. If you have another interface that is on the same Layer 2 domain, it will see the ARP requests and will answer with the MAC address of its interface. The result of this is that the return traffic of the VPN clients towards the internal hosts will go to the wrong interface and will get dropped. In this case, you need to disable proxy ARPs for the interface on which you do not want proxy ARPs.

To disable proxy ARPs, enter the following command:

Command	Purpose
<code>sysopt noproxyarp interface</code>	Disables proxy ARPs.
Example: <code>hostname(config)# sysopt noproxyarp exampleinterface</code>	

CHAPTER 22

Configuring Static and Default Routes

This chapter describes how to configure static and default routes on the ASA and includes the following sections:

- [Information About Static and Default Routes, page 22-1](#)
- [Licensing Requirements for Static and Default Routes, page 22-2](#)
- [Guidelines and Limitations, page 22-2](#)
- [Configuring Static and Default Routes, page 22-2](#)
- [Monitoring a Static or Default Route, page 22-6](#)
- [Configuration Examples for Static or Default Routes, page 22-8](#)
- [Feature History for Static and Default Routes, page 22-8](#)

Information About Static and Default Routes

To route traffic to a nonconnected host or network, you must define a static route to the host or network or, at a minimum, a default route for any networks to which the ASA is not directly connected; for example, when there is a router between a network and the ASA.

Without a static or default route defined, traffic to nonconnected hosts or networks generates the following syslog message:

```
%ASA-6-110001: No route to dest_address from source_address
```

Multiple context mode does not support dynamic routing.

You might want to use static routes in single context mode in the following cases:

- Your networks use a different router discovery protocol from EIGRP, RIP, or OSPF.
- Your network is small and you can easily manage static routes.
- You do not want the traffic or CPU overhead associated with routing protocols.

The simplest option is to configure a default route to send all traffic to an upstream router, relying on the router to route the traffic for you. However, in some cases the default gateway might not be able to reach the destination network, so you must also configure more specific static routes. For example, if the default gateway is outside, then the default route cannot direct traffic to any inside networks that are not directly connected to the ASA.

In transparent firewall mode, for traffic that originates on the ASA and is destined for a nondirectly connected network, you need to configure either a default route or static routes so the ASA knows out of which interface to send traffic. Traffic that originates on the ASA might include communications to a

syslog server, Websense or N2H2 server, or AAA server. If you have servers that cannot all be reached through a single default route, then you must configure static routes. Additionally, the ASA supports up to three equal cost routes on the same interface for load balancing.

Licensing Requirements for Static and Default Routes

The following table shows the licensing requirements for this feature:

Model	License Requirement
All models	Base License.

Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

Context Mode Guidelines

Supported in single and multiple context mode.

Firewall Mode Guidelines

Supported in routed and transparent firewall mode.

IPv6 Guidelines

Supports IPv6.

Failover Guidelines

Supports stateful failover of dynamic routing protocols.

Additional Guidelines

IPv6 static routes are not supported in transparent mode in ASDM.

Configuring Static and Default Routes

This section explains how to configure a static route and a static default route, and includes the following topics:

- [Configuring a Static Route, page 22-3](#)
- [Configuring a Default Static Route, page 22-4](#)
- [Configuring IPv6 Default and Static Routes, page 22-5](#)

Configuring a Static Route

Static routing algorithms are basically table mappings established by the network administrator before the beginning of routing. These mappings do not change unless the network administrator alters them. Algorithms that use static routes are simple to design and work well in environments where network traffic is relatively predictable and where network design is relatively simple. Because of this fact, static routing systems cannot react to network changes.

Static routes remain in the routing table even if the specified gateway becomes unavailable. If the specified gateway becomes unavailable, you need to remove the static route from the routing table manually. However, static routes are removed from the routing table if the specified interface goes down, and are reinstated when the interface comes back up.

Note

If you create a static route with an administrative distance greater than the administrative distance of the routing protocol running on the ASA, then a route to the specified destination discovered by the routing protocol takes precedence over the static route. The static route is used only if the dynamically discovered route is removed from the routing table.

You can define up to three equal cost routes to the same destination per interface. Equal-cost multi-path (ECMP) routing is not supported across multiple interfaces. With ECMP, the traffic is not necessarily divided evenly between the routes; traffic is distributed among the specified gateways based on an algorithm that hashes the source and destination IP addresses.

To configure a static route, see the following section:

- [Adding or Editing a Static Route, page 22-3](#)

Adding or Editing a Static Route

To add or edit a static route, enter the following command:

Command	Purpose
route <i>if_name dest_ip mask gateway_ip</i> <i>[distance]</i>	Enables you to add a static route. The <i>dest_ip</i> and <i>mask</i> arguments indicate the IP address for the destination network, and the <i>gateway_ip</i> argument is the address of the next-hop router. The addresses you specify for the static route are the addresses that are in the packet before entering the ASA and performing NAT. The <i>distance</i> argument is the administrative distance for the route. The default is 1 if you do not specify a value. Administrative distance is a parameter used to compare routes among different routing protocols. The default administrative distance for static routes is 1, giving it precedence over routes discovered by dynamic routing protocols but not directly connected routes. The default administrative distance for routes discovered by OSPF is 110. If a static route has the same administrative distance as a dynamic route, the static route takes precedence. Connected routes always take precedence over static or dynamically discovered routes.

Example:

```
hostname(config)# route outside 10.10.10.0
255.255.255.0 192.168.1.1 [1]
```

Examples

The following example shows static routes that are equal cost routes that direct traffic to three different gateways on the outside interface. The ASA distributes the traffic among the specified gateways.

```
hostname(config)# route outside 10.10.10.0 255.255.255.0 192.168.1.1
hostname(config)# route outside 10.10.10.0 255.255.255.0 192.168.1.2
hostname(config)# route outside 10.10.10.0 255.255.255.0 192.168.1.3
```

Configuring a Default Static Route

A default route identifies the gateway IP address to which the ASA sends all IP packets for which it does not have a learned or static route. A default static route is simply a static route with 0.0.0.0/0 as the destination IP address. Routes that identify a specific destination take precedence over the default route.

Note

In Versions 7.0(1) and later, if you have two default routes configured on different interfaces that have different metrics, the connection to the ASA that is made from the higher metric interface fails, but connections to the ASA from the lower metric interface succeed as expected.

You can define up to three equal cost default route entries per device. Defining more than one equal cost default route entry causes the traffic sent to the default route to be distributed among the specified gateways. When defining more than one default route, you must specify the same interface for each entry.

If you attempt to define more than three equal cost default routes or a default route with a different interface than a previously defined default route, you receive the following message:

```
"ERROR: Cannot add route entry, possible conflict with existing routes."
```

You can define a separate default route for tunneled traffic along with the standard default route. When you create a default route with the tunneled option, all traffic from a tunnel terminating on the ASA that cannot be routed using learned or static routes is sent to this route. For traffic emerging from a tunnel, this route overrides any other configured or learned default routes.

Limitations on Configuring a Default Static Route

The following restrictions apply to default routes with the tunneled option:

- Do not enable unicast RPF (**ip verify reverse-path** command) on the egress interface of a tunneled route, because this setting causes the session to fail.
- Do not enable TCP intercept on the egress interface of the tunneled route, because this setting causes the session to fail.
- Do not use the VoIP inspection engines (CTIQBE, H.323, GTP, MGCP, RTSP, SIP, SKINNY), the DNS inspect engine, or the DCE RPC inspection engine with tunneled routes, because these inspection engines ignore the tunneled route.
- You cannot define more than one default route with the tunneled option.
- ECMP for tunneled traffic is not supported.

To add or edit a tunneled default static route, enter the following command:

Command	Purpose
route <i>if_name</i> 0.0.0.0 0.0.0.0 <i>gateway_ip</i> [<i>distance</i> <i>tunneled</i>] Example: hostname(config)# route outside 0 0 192.168.2.4 tunneled	Enables you to add a static route. The <i>dest_ip</i> and <i>mask</i> arguments indicate the IP address for the destination network and the <i>gateway_ip</i> argument is the address of the next hop router. The addresses you specify for the static route are the addresses that are in the packet before entering the ASA and performing NAT. The <i>distance</i> argument is the administrative distance for the route. The default is 1 if you do not specify a value. Administrative distance is a parameter used to compare routes among different routing protocols. The default administrative distance for static routes is 1, giving it precedence over routes discovered by dynamic routing protocols but not directly connect routes. The default administrative distance for routes discovered by OSPF is 110. If a static route has the same administrative distance as a dynamic route, the static routes take precedence. Connected routes always take precedence over static or dynamically discovered routes.

**Tip**

You can enter 0 0 instead of 0.0.0.0 0.0.0.0 for the destination network address and mask, as shown in the following example:

```
hostname(config)# route outside 0 0 192.168.1 1
```

Configuring IPv6 Default and Static Routes

The ASA automatically routes IPv6 traffic between directly connected hosts if the interfaces to which the hosts are attached are enabled for IPv6 and the IPv6 ACLs allow the traffic.

To configure an IPv6 default route and static routes, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	ipv6 route <i>if_name</i> ::/0 <i>next_hop_ipv6_addr</i> Example: hostname(config)# ipv6 route inside 7fff::0/32 3FFE:1100:0:CC00::1	Adds a default IPv6 route. The example routes packets for network 7fff::0/32 to a networking device on the inside interface at 3FFE:1100:0:CC00::1 The address ::/0 is the IPv6 equivalent of any.
Step 2	ipv6 route <i>if_name</i> <i>destination</i> <i>next_hop_ipv6_addr</i> [<i>admin_distance</i>] Example: hostname(config)# ipv6 route inside 7fff::0/32 3FFE:1100:0:CC00::1 [110]	Adds an IPv6 static route to the IPv6 routing table. The example routes packets for network 7fff::0/32 to a networking device on the inside interface at 3FFE:1100:0:CC00::1, and with an administrative distance of 110.

**Note**

The **ipv6 route** command works the same way as the **route** command, which is used to define IPv4 static routes.

Monitoring a Static or Default Route

One of the problems with static routes is that there is no inherent mechanism for determining if the route is up or down. They remain in the routing table even if the next hop gateway becomes unavailable. Static routes are only removed from the routing table if the associated interface on the ASA goes down.

The static route tracking feature provides a method for tracking the availability of a static route and installing a backup route if the primary route should fail. For example, you can define a default route to an ISP gateway and a backup default route to a secondary ISP in case the primary ISP becomes unavailable.

The ASA implements this feature by associating a static route with a monitoring target that you define, and monitors the target using ICMP echo requests. If an echo reply is not received within a specified time period, the object is considered down and the associated route is removed from the routing table. A previously configured backup route is used in place of the removed route.

When selecting a monitoring target, you need to make sure that it can respond to ICMP echo requests. The target can be any network object that you choose, but you should consider using the following:

- The ISP gateway (for dual ISP support) address
- The next hop gateway address (if you are concerned about the availability of the gateway)
- A server on the target network, such as a AAA server, that the ASA needs to communicate with
- A persistent network object on the destination network

**Note**

A desktop or notebook computer that may be shut down at night is not a good choice.

You can configure static route tracking for statically defined routes or default routes obtained through DHCP or PPPoE. You can only enable PPPoE clients on multiple interfaces with route tracking configured.

To configure static route tracking, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	sla monitor <i>sla_id</i> Example: hostname(config)# sla monitor <i>sla_id</i>	Configures the tracked object monitoring parameters by defining the monitoring process. If you are configuring a new monitoring process, you enter sla monitor configuration mode. If you are changing the monitoring parameters for an unscheduled monitoring process that already has a type defined, you automatically enter sla protocol configuration mode.
Step 2	type echo protocol ipIcmpEcho <i>target_ip</i> interface <i>if_name</i> Example: hostname(config-sla-monitor)# type echo protocol ipIcmpEcho <i>target_ip</i> interface <i>if_name</i>	Specifies the monitoring protocol. If you are changing the monitoring parameters for an unscheduled monitoring process that already has a type defined, you automatically enter sla protocol configuration mode and cannot change this setting. The <i>target_ip</i> argument is the IP address of the network object whose availability the tracking process monitors. While this object is available, the tracking process route is installed in the routing table. When this object becomes unavailable, the tracking process removes the route and the backup route is used in its place.
Step 3	sla monitor schedule <i>sla_id</i> [life { forever <i>seconds</i> }] [start-time { <i>hh:mm[:ss]</i> [<i>month day</i> <i>day month</i>] <i>pending</i> <i>now</i> after <i>hh:mm:ss</i> }] [ageout <i>seconds</i>] [recurring] Example: hostname(config)# sla monitor schedule <i>sla_id</i> [life { forever <i>seconds</i> }] [start-time { <i>hh:mm[:ss]</i> [<i>month day</i> <i>day month</i>] <i>pending</i> <i>now</i> after <i>hh:mm:ss</i> }] [ageout <i>seconds</i>] [recurring]	Schedules the monitoring process. Typically, you will use the sla monitor schedule <i>sla_id</i> life forever start-time now command for the monitoring schedule, and allow the monitoring configuration to determine how often the testing occurs. However, you can schedule this monitoring process to begin in the future and to only occur at specified times.
Step 4	track <i>track_id</i> rtr <i>sla_id</i> reachability Example: hostname(config)# track <i>track_id</i> rtr <i>sla_id</i> reachability	Associates a tracked static route with the SLA monitoring process. The <i>track_id</i> argument is a tracking number you assign with this command. The <i>sla_id</i> argument is the ID number of the SLA process.
Step 5	Do one of the following to define the static route to be installed in the routing table while the tracked object is reachable. These options allow you to track a static route or a default route obtained through DHCP or PPPOE. route <i>if_name</i> <i>dest_ip</i> <i>mask</i> <i>gateway_ip</i> [<i>admin_distance</i>] track <i>track_id</i> Example: hostname(config)# route <i>if_name</i> <i>dest_ip</i> <i>mask</i> <i>gateway_ip</i> [<i>admin_distance</i>] track <i>track_id</i>	Tracks a static route. You cannot use the tunneled option with the route command in static route tracking.

Command	Purpose
Example: <pre>hostname(config)# interface phy_if hostname(config-if)# dhcp client route track track_id hostname(config-if)# ip address dhcp setroute hostname(config-if)# exit</pre>	Tracks a default route obtained through DHCP. Remember that you must use the setroute keyword with the ip address dhcp command to obtain the default route using DHCP.
Example: <pre>hostname(config)# interface phy_if hostname(config-if)# pppoe client route track track_id hostname(config-if)# ip address pppoe setroute hostname(config-if)# exit</pre>	Tracks a default route obtained through PPPoE. You must use the setroute keyword with the ip address pppoe command to obtain the default route using PPPoE.

Configuration Examples for Static or Default Routes

The following example shows how to create a static route that sends all traffic destined for 10.1.1.0/24 to the router 10.1.2.45, which is connected to the inside interface, defines three equal cost static routes that direct traffic to three different gateways on the outside interface, and adds a default route for tunneled traffic. The ASA then distributes the traffic among the specified gateways:

```
hostname(config)# route inside 10.1.1.0 255.255.255.0 10.1.2.45 1
hostname(config)# route outside 10.10.10.0 255.255.255.0 192.168.2.1
hostname(config)# route outside 10.10.10.0 255.255.255.0 192.168.2.2
hostname(config)# route outside 10.10.10.0 255.255.255.0 192.168.2.3
hostname(config)# route outside 0 0 192.168.2.4 tunneled
```

Unencrypted traffic received by the ASA for which there is no static or learned route is distributed among the gateways with the IP addresses 192.168.2.1, 192.168.2.2, and 192.168.2.3. Encrypted traffic received by the ASA for which there is no static or learned route is passed to the gateway with the IP address 192.168.2.4.

The following example creates a static route that sends all traffic destined for 10.1.1.0/24 to the router (10.1.2.45) connected to the inside interface:

```
hostname(config)# route inside 10.1.1.0 255.255.255.0 10.1.2.45 1
```

Feature History for Static and Default Routes

Table 22-1 lists each feature change and the platform release in which it was implemented.

Table 22-1 Feature History for Static and Default Routes

Feature Name	Platform Releases	Feature Information
Routing	7.0(1)	Static and default routing were introduced. We introduced the route command.

CHAPTER 23

Defining Route Maps

This chapter describes route maps and includes the following sections:

- [Information About Route Maps, page 23-1](#)
- [Licensing Requirements for Route Maps, page 23-3](#)
- [Guidelines and Limitations, page 23-3](#)
- [Defining a Route Map, page 23-4](#)
- [Customizing a Route Map, page 23-4](#)
- [Configuration Example for Route Maps, page 23-6](#)
- [Feature History for Route Maps, page 23-6](#)

Information About Route Maps

Route maps are used when redistributing routes into an OSPF, RIP, or EIGRP routing process. They are also used when generating a default route into an OSPF routing process. A route map defines which of the routes from the specified routing protocol are allowed to be redistributed into the target routing process.

Route maps have many features in common with widely known ACLs. These are some of the traits common to both:

- They are an ordered sequence of individual statements, each has a permit or deny result. Evaluation of ACL or route maps consists of a list scan, in a predetermined order, and an evaluation of the criteria of each statement that matches. A list scan is aborted once the first statement match is found and an action associated with the statement match is performed.
- They are generic mechanisms—criteria matches and match interpretation are dictated by the way that they are applied. The same route map applied to different tasks might be interpreted differently.

These are some of the differences between route maps and ACLs:

- Route maps frequently use ACLs as matching criteria.
- The main result from the evaluation of an access list is a yes or no answer—an ACL either permits or denies input data. Applied to redistribution, an ACL determines if a particular route can (route matches ACLs permit statement) or can not (matches deny statement) be redistributed. Typical route maps not only permit (some) redistributed routes but also modify information associated with the route, when it is redistributed into another protocol.
- Route maps are more flexible than ACLs and can verify routes based on criteria which ACLs can not verify. For example, a route map can verify if the type of route is internal.

- Each ACL ends with an implicit deny statement, by design convention; there is no similar convention for route maps. If the end of a route map is reached during matching attempts, the result depends on the specific application of the route map. Fortunately, route maps that are applied to redistribution behave the same way as ACLs: if the route does not match any clause in a route map then the route redistribution is denied, as if the route map contained deny statement at the end.

The dynamic protocol **redistribute** command allows you to apply a route map. In ASDM, this capability for redistribution can be found when you add or edit a new route map (see the [“Defining a Route Map” section on page 23-4](#)). Route maps are preferred if you intend to either modify route information during redistribution or if you need more powerful matching capability than an ACL can provide. If you simply need to selectively permit some routes based on their prefix or mask, we recommend that you use a route map to map to an ACL (or equivalent prefix list) directly in the **redistribute** command. If you use a route map to selectively permit some routes based on their prefix or mask, you typically use more configuration commands to achieve the same goal.

**Note**

You must use a standard ACL as the match criterion for your route map. Using an extended ACL will not work, and your routes will never be redistributed. We recommend that you number clauses in intervals of 10, to reserve numbering space in case you need to insert clauses in the future.

This section includes the following topics:

- [Permit and Deny Clauses, page 23-2](#)
- [Match and Set Clause Values, page 23-2](#)

Permit and Deny Clauses

Route maps can have permit and deny clauses. In the **route-map ospf-to-eigrp** command, there is one deny clause (with sequence number 10) and two permit clauses. The deny clause rejects route matches from redistribution. Therefore, the following rules apply:

- If you use an ACL in a route map using a permit clause, routes that are permitted by the ACL are redistributed.
- If you use an ACL in a route map deny clause, routes that are permitted by the ACL are not redistributed.
- If you use an ACL in a route map permit or deny clause, and the ACL denies a route, then the route map clause match is not found and the next route-map clause is evaluated.

Match and Set Clause Values

Each route map clause has two types of values:

- A match value selects routes to which this clause should be applied.
- A set value modifies information that will be redistributed into the target protocol.

For each route that is being redistributed, the router first evaluates the match criteria of a clause in the route map. If the match criteria succeed, then the route is redistributed or rejected as dictated by the permit or deny clause, and some of its attributes might be modified by the values set from the Set Value tab in ASDM or from the **set** commands. If the match criteria fail, then this clause is not applicable to the route, and the software proceeds to evaluate the route against the next clause in the route map.

Scanning of the route map continues until a clause is found whose **match** command(s), or Match Clause as set from the Match Clause tab in ASDM, match the route or until the end of the route map is reached.

A match or set value in each clause can be missed or repeated several times, if one of these conditions exists:

- If several **match** commands or Match Clause values in ASDM are present in a clause, all must succeed for a given route in order for that route to match the clause (in other words, the logical AND algorithm is applied for multiple match commands).
- If a **match** command or Match Clause value in ASDM refers to several objects in one command, either of them should match (the logical OR algorithm is applied). For example, in the **match ip address 101 121** command, a route is permitted if access list 101 or access list 121 permits it.
- If a **match** command or Match Clause value in ASDM is not present, all routes match the clause. In the previous example, all routes that reach clause 30 match; therefore, the end of the route map is never reached.
- If a **set** command, or Set Value in ASDM, is not present in a route map permit clause, then the route is redistributed without modification of its current attributes.

**Note**

Do not configure a **set** command in a route map deny clause because the deny clause prohibits route redistribution—there is no information to modify.

A route map clause without a **match** or **set** command, or Match or Set Value as set on the Match or Set Value tab in ASDM, performs an action. An empty permit clause allows a redistribution of the remaining routes without modification. An empty deny clause does not allow a redistribution of other routes (this is the default action if a route map is completely scanned, but no explicit match is found).

Licensing Requirements for Route Maps

The following table shows the licensing requirements for route maps:

Model	License Requirement
All models	Base License.

Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

Context Mode Guidelines

Supported in single context mode.

Firewall Mode Guidelines

Supported only in routed firewall mode. Transparent firewall mode is not supported.

IPv6 Guidelines

Does not support IPv6.

Defining a Route Map

You must define a route map when specifying which of the routes from the specified routing protocol are allowed to be redistributed into the target routing process.

To define a route map, enter the following command:

Command	Purpose
route-map <i>name</i> { permit deny } [<i>sequence_number</i>] Example: hostname(config)# route-map <i>name</i> {permit} [12]	Creates the route map entry. Enters route-map configuration mode. Route map entries are read in order. You can identify the order using the <i>sequence_number</i> argument, or the ASA uses the order in which you add route map entries.

Customizing a Route Map

- This section describes how to customize the route map and includes the following topics:
- Defining a Route to Match a Specific Destination Address, page 23-4
 - Configuring the Metric Values for a Route Action, page 23-5

Defining a Route to Match a Specific Destination Address

To define a route to match a specified destination address, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	route-map <i>name</i> { permit deny } [<i>sequence_number</i>] Example: hostname(config)# route-map <i>name</i> {permit} [12]	Creates the route map entry. Enters route-map configuration mode. Route map entries are read in order. You can identify the order using the <i>sequence_number</i> option, or the ASA uses the order in which you add route map entries.
Step 2	Enter one of the following match commands to match routes to a specified destination address: match ip address <i>acl_id</i> [<i>acl_id</i>] [...] [<i>prefix-list</i>] Example: hostname(config-route-map)# match ip address <i>acl_id</i> [<i>acl_id</i>] [...] [<i>prefix-list</i>]	Matches any routes that have a destination network that matches a standard ACL or prefix list. If you specify more than one ACL, then the route can match any of the ACLs.

Command	Purpose
match metric <i>metric_value</i> Example: hostname(config-route-map)# match metric 200	Matches any routes that have a specified metric. The <i>metric_value</i> can range from 0 to 4294967295.
match ip next-hop <i>acl_id</i> [<i>acl_id</i>] [...]	Matches any routes that have a next hop router address that matches a standard ACL. If you specify more than one ACL, then the route can match any of the ACLs.
match interface <i>if_name</i> Example: hostname(config-route-map)# match interface <i>if_name</i>	Matches any routes with the specified next hop interface. If you specify more than one interface, then the route can match either interface.
match ip route-source <i>acl_id</i> [<i>acl_id</i>] [...]	Matches any routes that have been advertised by routers that match a standard ACL. If you specify more than one ACL, then the route can match any of the ACLs.
match route-type { internal external [type-1 type-2]}	Matches the route type.
Example: hostname(config-route-map)# match route-type internal type-1	

Configuring the Metric Values for a Route Action

If a route matches the **match** commands, then the following **set** commands determine the action to perform on the route before redistributing it.

To configure the metric value for a route action, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	route-map <i>name</i> { permit deny } [<i>sequence_number</i>] Example: hostname(config)# route-map <i>name</i> {permit} [12]	Creates the route map entry. Route map entries are read in order. You can identify the order using the <i>sequence_number</i> argument, or the ASA uses the order in which you add route map entries.
Step 2	To set a metric for the route map, enter one or more of the following set commands:	

Command	Purpose
set metric <i>metric_value</i> Example: hostname(config-route-map)# set metric 200	Sets the metric value. The <i>metric_value</i> argument can range from 0 to 294967295.
set metric-type { type-1 type-2 } Example: hostname(config-route-map)# set metric-type type-2	Sets the metric type. The <i>metric-type</i> argument can be type-1 or type-2.

Configuration Example for Route Maps

The following example shows how to redistribute routes with a hop count equal to 1 into OSPF. The ASA redistributes these routes as external LSAs with a metric of 5 and a metric type of Type 1.

```
hostname(config)# route-map 1-to-2 permit
hostname(config-route-map)# match metric 1
hostname(config-route-map)# set metric 5
hostname(config-route-map)# set metric-type type-1
```

The following example shows how to redistribute the 10.1.1.0 static route into eigrp process 1 with the configured metric value:

```
hostname(config)# route outside 10.1.1.0 255.255.255.0 192.168.1.1
hostname(config-route-map)# access-list mymap2 line 1 permit 10.1.1.0 255.255.255.0
hostname(config-route-map)# route-map mymap2 permit 10
hostname(config-route-map)# match ip address mymap2
hostname(config-route-map)# router eigrp 1
hostname(config)# redistribute static metric 250 250 1 1 1 route-map mymap2
```

Feature History for Route Maps

Table 23-1 lists each feature change and the platform release in which it was implemented.

Table 23-1 Feature History for Route Maps

Feature Name	Platform Releases	Feature Information
Route maps	7.0(1)	We introduced this feature. We introduced the following command: route-map .
Enhanced support for static and dynamic route maps	8.0(2)	Enhanced support for dynamic and static route maps was added.
Support for stateful failover of dynamic routing protocols (EIGRP, OSPF, and RIP) and debugging of general routing-related operations	8.4(1)	We introduced the following commands: debug route , show debug route . We modified the following command: show route .

CHAPTER 24

Configuring OSPF

This chapter describes how to configure the ASA to route data, perform authentication, and redistribute routing information using the Open Shortest Path First (OSPF) routing protocol.

The chapter includes the following sections:

- [Information About OSPF, page 24-1](#)
- [Licensing Requirements for OSPF, page 24-2](#)
- [Guidelines and Limitations, page 24-3](#)
- [Configuring OSPF, page 24-3](#)
- [Customizing OSPF, page 24-4](#)
- [Restarting the OSPF Process, page 24-14](#)
- [Configuration Example for OSPF, page 24-14](#)
- [Monitoring OSPF, page 24-16](#)
- [Feature History for OSPF, page 24-17](#)

Information About OSPF

OSPF is an interior gateway routing protocol that uses link states rather than distance vectors for path selection. OSPF propagates link-state advertisements rather than routing table updates. Because only LSAs are exchanged instead of the entire routing tables, OSPF networks converge more quickly than RIP networks.

OSPF uses a link-state algorithm to build and calculate the shortest path to all known destinations. Each router in an OSPF area contains an identical link-state database, which is a list of each of the router usable interfaces and reachable neighbors.

The advantages of OSPF over RIP include the following:

- OSPF link-state database updates are sent less frequently than RIP updates, and the link-state database is updated instantly, rather than gradually, as stale information is timed out.
- Routing decisions are based on cost, which is an indication of the overhead required to send packets across a certain interface. The ASA calculates the cost of an interface based on link bandwidth rather than the number of hops to the destination. The cost can be configured to specify preferred paths.

The disadvantage of shortest path first algorithms is that they require a lot of CPU cycles and memory.

The ASA can run two processes of OSPF protocol simultaneously on different sets of interfaces. You might want to run two processes if you have interfaces that use the same IP addresses (NAT allows these interfaces to coexist, but OSPF does not allow overlapping addresses). Or you might want to run one process on the inside and another on the outside, and redistribute a subset of routes between the two processes. Similarly, you might need to segregate private addresses from public addresses.

You can redistribute routes into an OSPF routing process from another OSPF routing process, a RIP routing process, or from static and connected routes configured on OSPF-enabled interfaces.

The ASA supports the following OSPF features:

- Support of intra-area, interarea, and external (Type I and Type II) routes.
- Support of a virtual link.
- OSPF LSA flooding.
- Authentication to OSPF packets (both password and MD5 authentication).
- Support for configuring the ASA as a designated router or a designated backup router. The ASA also can be set up as an ABR.
- Support for stub areas and not-so-stubby areas.
- Area boundary router Type 3 LSA filtering.

OSPF supports MD5 and clear text neighbor authentication. Authentication should be used with all routing protocols when possible because route redistribution between OSPF and other protocols (like RIP) can potentially be used by attackers to subvert routing information.

If NAT is used, if OSPF is operating on public and private areas, and if address filtering is required, then you need to run two OSPF processes—one process for the public areas and one for the private areas.

A router that has interfaces in multiple areas is called an Area Border Router (ABR). A router that acts as a gateway to redistribute traffic between routers using OSPF and routers using other routing protocols is called an Autonomous System Boundary Router (ASBR).

An ABR uses LSAs to send information about available routes to other OSPF routers. Using ABR Type 3 LSA filtering, you can have separate private and public areas with the ASA acting as an ABR. Type 3 LSAs (interarea routes) can be filtered from one area to other, which allows you to use NAT and OSPF together without advertising private networks.

**Note**

Only Type 3 LSAs can be filtered. If you configure the ASA as an ASBR in a private network, it will send Type 5 LSAs describing private networks, which will get flooded to the entire AS, including public areas.

If NAT is employed but OSPF is only running in public areas, then routes to public networks can be redistributed inside the private network, either as default or Type 5 AS External LSAs. However, you need to configure static routes for the private networks protected by the ASA. Also, you should not mix public and private networks on the same ASA interface.

You can have two OSPF routing processes, one RIP routing process, and one EIGRP routing process running on the ASA at the same time.

Licensing Requirements for OSPF

The following table shows the licensing requirements for this feature:

Model	License Requirement
All models	Base License.

Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

Context Mode Guidelines

Supported in single context mode.

Firewall Mode Guidelines

Supported in routed firewall mode only. Transparent firewall mode is not supported.

IPv6 Guidelines

Does not support IPv6.

Configuring OSPF

This section describes how to enable an OSPF process on the ASA.

After you enable OSPF, you need to define a route map. For more information, see the [“Defining a Route Map” section on page 23-4](#). Then you generate a default route. For more information, see the [“Configuring Static and Default Routes” section on page 22-2](#).

After you have defined a route map for the OSPF process, you can customize the OSPF process to suit your particular needs. To learn how to customize the OSPF process on the ASA, see the [“Customizing OSPF” section on page 24-4](#).

To enable OSPF, you need to create an OSPF routing process, specify the range of IP addresses associated with the routing process, then assign area IDs associated with that range of IP addresses.

You can enable up to two OSPF process instances. Each OSPF process has its own associated areas and networks.

To enable OSPF, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router ospf <i>process_id</i> Example: hostname(config)# router ospf 2	Creates an OSPF routing process and enters router configuration mode for this OSPF process. The <i>process_id</i> argument is an internally used identifier for this routing process and can be any positive integer. This ID does not have to match the ID on any other device; it is for internal use only. You can use a maximum of two processes. If there is only one OSPF process enabled on the ASA, then that process is selected by default. You cannot change the OSPF process ID when editing an existing area.
Step 2	network <i>ip_address mask area area_id</i> Example: hostname(config)# router ospf 2 hostname(config-router)# network 10.0.0.0 255.0.0.0 area 0	Defines the IP addresses on which OSPF runs and the area ID for that interface. When adding a new area, enter the area ID. You can specify the area ID as either a decimal number or an IP address. Valid decimal values range from 0-4294967295. You cannot change the area ID when editing an existing area.

Customizing OSPF

This section explains how to customize the OSPF process and includes the following topics:

- [Redistributing Routes Into OSPF, page 24-4](#)
- [Configuring Route Summarization When Redistributing Routes Into OSPF, page 24-6](#)
- [Configuring Route Summarization Between OSPF Areas, page 24-7](#)
- [Configuring OSPF Interface Parameters, page 24-8](#)
- [Configuring OSPF Area Parameters, page 24-10](#)
- [Configuring OSPF NSSA, page 24-11](#)
- [Defining Static OSPF Neighbors, page 24-12](#)
- [Configuring Route Calculation Timers, page 24-13](#)
- [Logging Neighbors Going Up or Down, page 24-13](#)

Redistributing Routes Into OSPF

The ASA can control the redistribution of routes between OSPF routing processes.

Note

If you want to redistribute a route by defining which of the routes from the specified routing protocol are allowed to be redistributed into the target routing process, you must first generate a default route. See the [“Configuring Static and Default Routes” section on page 22-2](#), and then define a route map according to the [“Defining a Route Map” section on page 23-4](#).

To redistribute static, connected, RIP, or OSPF routes into an OSPF process, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router ospf <i>process_id</i> Example: hostname(config)# router ospf 2	Creates an OSPF routing process and enters router configuration mode for the OSPF process that you want to redistribute. The <i>process_id</i> argument is an internally used identifier for this routing process and can be any positive integer. This ID does not have to match the ID on any other device; it is for internal use only. You can use a maximum of two processes.
Step 2	Do one of the following to redistribute the selected route type into the OSPF routing process: redistribute connected [metric <i>metric-value</i>] [metric-type {type-1 type-2}] [tag <i>tag_value</i>] [subnets] [route-map <i>map_name</i>] Example: hostname(config)# redistribute connected 5 type-1 route-map-practice redistribute static [metric <i>metric-value</i>] [metric-type {type-1 type-2}] [tag <i>tag_value</i>] [subnets] [route-map <i>map_name</i>] Example: hostname(config)# redistribute static 5 type-1 route-map-practice redistribute ospf <i>pid</i> [match {internal external [1 2] nssa-external [1 2]}] [metric <i>metric-value</i>] [metric-type {type-1 type-2}] [tag <i>tag_value</i>] [subnets] [route-map <i>map_name</i>] Example: hostname(config)# route-map 1-to-2 permit hostname(config-route-map)# match metric 1 hostname(config-route-map)# set metric 5 hostname(config-route-map)# set metric-type type-1 hostname(config-route-map)# router ospf 2 hostname(config-router)# redistribute ospf 1 route-map 1-to-2	Redistributes connected routes into the OSPF routing process. Redistributes static routes into the OSPF routing process. Allows you to redistribute routes from an OSPF routing process into another OSPF routing process. You can either use the match options in this command to match and set route properties, or you can use a route map. The subnets option does not have equivalents in the route-map command. If you use both a route map and match options in the redistribute command, then they must match. The example shows route redistribution from OSPF process 1 into OSPF process 2 by matching routes with a metric equal to 1. The ASA redistributes these routes as external LSAs with a metric of 5 and a metric type of Type 1.

Command	Purpose
redistribute rip [metric <i>metric-value</i>] [metric-type { type-1 type-2 }] [tag <i>tag_value</i>] [subnets] [route-map <i>map_name</i>] Example: hostname(config)# redistribute rip 5 hostname(config-route-map)# match metric 1 hostname(config-route-map)# set metric 5 hostname(config-route-map)# set metric-type type-1 hostname(config-router)# redistribute ospf 1 route-map 1-to-2	Allows you to redistribute routes from a RIP routing process into the OSPF routing process.
redistribute eigrp as-num [metric <i>metric-value</i>] [metric-type { type-1 type-2 }] [tag <i>tag_value</i>] [subnets] [route-map <i>map_name</i>] Example: hostname(config)# redistribute eigrp 2 hostname(config-route-map)# match metric 1 hostname(config-route-map)# set metric 5 hostname(config-route-map)# set metric-type type-1 hostname(config-router)# redistribute ospf 1 route-map 1-to-2	Allows you to redistribute routes from an EIGRP routing process into the OSPF routing process.

Configuring Route Summarization When Redistributing Routes Into OSPF

When routes from other protocols are redistributed into OSPF, each route is advertised individually in an external LSA. However, you can configure the ASA to advertise a single route for all the redistributed routes that are included for a specified network address and mask. This configuration decreases the size of the OSPF link-state database.

Routes that match the specified IP Address mask pair can be suppressed. The tag value can be used as a match value for controlling redistribution through route maps.

To configure the software advertisement on one summary route for all redistributed routes included for a network address and mask, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router ospf <i>process_id</i>	Creates an OSPF routing process and enters router configuration mode for this OSPF process.
	Example: hostname(config)# router ospf 1	The <i>process_id</i> argument is an internally used identifier for this routing process and can be any positive integer. This ID does not have to match the ID on any other device; it is for internal use only. You can use a maximum of two processes.
Step 2	summary-address <i>ip_address mask</i> [not-advertise] [tag tag]	Sets the summary address.
	Example: hostname(config)# router ospf 1 hostname(config-router)# summary-address 10.1.0.0 255.255.0.0	In this example, the summary address 10.1.0.0 includes addresses 10.1.1.0, 10.1.2.0, 10.1.3.0, and so on. Only the 10.1.0.0 address is advertised in an external link-state advertisement.

Configuring Route Summarization Between OSPF Areas

Route summarization is the consolidation of advertised addresses. This feature causes a single summary route to be advertised to other areas by an area boundary router. In OSPF, an area boundary router advertises networks in one area into another area. If the network numbers in an area are assigned in a way so that they are contiguous, you can configure the area boundary router to advertise a summary route that includes all the individual networks within the area that fall into the specified range.

To define an address range for route summarization, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router ospf <i>process_id</i>	Creates an OSPF routing process and enters router configuration mode for this OSPF process.
	Example: hostname(config)# router ospf 1	The <i>process_id</i> argument is an internally used identifier for this routing process. It can be any positive integer. This ID does not have to match the ID on any other device; it is for internal use only. You can use a maximum of two processes.
Step 2	area <i>area-id</i> range <i>ip-address mask</i> [advertise not-advertise]	Sets the address range.
	Example: hostname(config)# router ospf 1 hostname(config-router)# area 17 range 12.1.0.0 255.255.0.0	In this example, the address range is set between OSPF areas.

Configuring OSPF Interface Parameters

You can change some interface-specific OSPF parameters, if necessary.

Prerequisites

You are not required to change any of these parameters, but the following interface parameters must be consistent across all routers in an attached network: **ospf hello-interval**, **ospf dead-interval**, and **ospf authentication-key**. If you configure any of these parameters, be sure that the configurations for all routers on your network have compatible values.

To configure OSPF interface parameters, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router ospf <i>process_id</i>	Creates an OSPF routing process and enters router configuration mode for the OSPF process that you want to redistribute.
	Example: hostname(config)# router ospf 2	The <i>process_id</i> argument is an internally used identifier for this routing process and can be any positive integer. This ID does not have to match the ID on any other device; it is for internal use only. You can use a maximum of two processes.
Step 2	network <i>ip_address mask area</i> <i>area_id</i>	Defines the IP addresses on which OSPF runs and the area ID for that interface.
	Example: hostname(config)# router ospf 2 hostname(config-router)# network 10.0.0.0 255.0.0.0 area 0	
Step 3	hostname(config)# interface <i>interface_name</i>	Allows you to enter interface configuration mode.
	Example: hostname(config)# interface my_interface	
Step 4	Do one of the following to configure optional OSPF interface parameters:	
	ospf authentication [message-digest null]	Specifies the authentication type for an interface.
	Example: hostname(config-interface)# ospf authentication message-digest	

Command	Purpose
ospf authentication-key <i>key</i> Example: <pre>hostname(config-interface)# ospf authentication-key cisco</pre>	Allows you to assign a password to be used by neighboring OSPF routers on a network segment that is using the OSPF simple password authentication. The <i>key</i> argument can be any continuous string of characters up to 8 bytes in length. The password created by this command is used as a key that is inserted directly into the OSPF header when the ASA software originates routing protocol packets. A separate password can be assigned to each network on a per-interface basis. All neighboring routers on the same network must have the same password to be able to exchange OSPF information.
ospf cost <i>cost</i> Example: <pre>hostname(config-interface)# ospf cost 20</pre>	Allows you to explicitly specify the cost of sending a packet on an OSPF interface. The <i>cost</i> is an integer from 1 to 65535. In this example, the cost is set to 20.
ospf dead-interval <i>seconds</i> Example: <pre>hostname(config-interface)# ospf dead-interval 40</pre>	Allows you to set the number of seconds that a device must wait before it declares a neighbor OSPF router down because it has not received a hello packet. The value must be the same for all nodes on the network. In this example, the dead interval is set to 40.
ospf hello-interval <i>seconds</i> Example: <pre>hostname(config-interface)# ospf hello-interval 10</pre>	Allows you to specify the length of time between the hello packets that the ASA sends on an OSPF interface. The value must be the same for all nodes on the network. In this example, the hello interval is set to 10.
ospf message-digest-key <i>key_id md5 key</i> Example: <pre>hostname(config-interface)# ospf message-digest-key 1 md5 cisco</pre>	Enables OSPF MD5 authentication. The following argument values can be set: <i>key_id</i>—An identifier in the range from 1 to 255. <i>key</i>—An alphanumeric password of up to 16 bytes. Usually, one key per interface is used to generate authentication information when sending packets and to authenticate incoming packets. The same key identifier on the neighbor router must have the same key value. We recommend that you not keep more than one key per interface. Every time you add a new key, you should remove the old key to prevent the local system from continuing to communicate with a hostile system that knows the old key. Removing the old key also reduces overhead during rollover.
ospf priority <i>number_value</i> Example: <pre>hostname(config-interface)# ospf priority 20</pre>	Allows you to set the priority to help determine the OSPF designated router for a network. The <i>number_value</i> argument ranges from 0 to 255. In this example, the priority number value is set to 20.

Command	Purpose
ospf retransmit-interval <i>seconds</i> Example: <pre>hostname(config-interface)# ospf retransmit-interval seconds</pre>	Allows you to specify the number of seconds between LSA retransmissions for adjacencies belonging to an OSPF interface. The value for <i>seconds</i> must be greater than the expected round-trip delay between any two routers on the attached network. The range is from 1 to 65535 seconds. The default value is 5 seconds. In this example, the retransmit-interval value is set to 15.
ospf transmit-delay <i>seconds</i> Example: <pre>hostname(config-interface)# ospf transmit-delay 5</pre>	Sets the estimated number of seconds required to send a link-state update packet on an OSPF interface. The <i>seconds</i> value ranges from 1 to 65535 seconds. The default value is 1 second. In this example, the transmit-delay is 5 seconds.
ospf network point-to-point non-broadcast Example: <pre>hostname(config-interface)# ospf network point-to-point non-broadcast</pre>	Specifies the interface as a point-to-point, nonbroadcast network. When you designate an interface as point-to-point, nonbroadcast, you must manually define the OSPF neighbor; dynamic neighbor discovery is not possible. See the “Defining Static OSPF Neighbors” section on page 24-12 for more information. Additionally, you can only define one OSPF neighbor on that interface.

Configuring OSPF Area Parameters

You can configure several OSPF area parameters. These area parameters (shown in the following task list) include setting authentication, defining stub areas, and assigning specific costs to the default summary route. Authentication provides password-based protection against unauthorized access to an area.

Stub areas are areas into which information on external routes is not sent. Instead, there is a default external route generated by the ABR into the stub area for destinations outside the autonomous system. To take advantage of the OSPF stub area support, default routing must be used in the stub area. To further reduce the number of LSAs sent into a stub area, you can use the **no-summary** keyword of the **area stub** command on the ABR to prevent it from sending a summary link advertisement (LSA Type 3) into the stub area.

To specify area parameters for your network, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router ospf <i>process_id</i> Example: <pre>hostname(config)# router ospf 2</pre>	Creates an OSPF routing process and enters router configuration mode for the OSPF process that you want to redistribute. The <i>process_id</i> argument is an internally used identifier for this routing process and can be any positive integer. This ID does not have to match the ID on any other device; it is for internal use only. You can use a maximum of two processes.
Step 2	Do one of the following to configure optional OSPF area parameters:	

Command	Purpose
area <i>area-id</i> authentication Example: <pre>hostname(config-router)# area 0 authentication</pre>	Enables authentication for an OSPF area.
area <i>area-id</i> authentication message-digest Example: <pre>hostname(config-router)# area 0 authentication message-digest</pre>	Enables MD5 authentication for an OSPF area.

Configuring OSPF NSSA

The OSPF implementation of an NSSA is similar to an OSPF stub area. NSSA does not flood Type 5 external LSAs from the core into the area, but it can import autonomous system external routes in a limited way within the area.

NSSA imports Type 7 autonomous system external routes within an NSSA area by redistribution. These Type 7 LSAs are translated into Type 5 LSAs by NSSA ABRs, which are flooded throughout the whole routing domain. Summarization and filtering are supported during the translation.

You can simplify administration if you are an ISP or a network administrator that must connect a central site using OSPF to a remote site that is using a different routing protocol using NSSA.

Before the implementation of NSSA, the connection between the corporate site border router and the remote router could not be run as an OSPF stub area because routes for the remote site could not be redistributed into the stub area, and two routing protocols needed to be maintained. A simple protocol such as RIP was usually run and handled the redistribution. With NSSA, you can extend OSPF to cover the remote connection by defining the area between the corporate router and the remote router as an NSSA.

Before you use this feature, consider these guidelines:

- You can set a Type 7 default route that can be used to reach external destinations. When configured, the router generates a Type 7 default into the NSSA or the NSSA area boundary router.
- Every router within the same area must agree that the area is NSSA; otherwise, the routers will not be able to communicate.

To specify area parameters for your network to configure OSPF NSSA, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router ospf <i>process_id</i> Example: <pre>hostname(config)# router ospf 2</pre>	Creates an OSPF routing process and enters router configuration mode for the OSPF process that you want to redistribute. The <i>process_id</i> argument is an internally used identifier for this routing process. It can be any positive integer. This ID does not have to match the ID on any other device; it is for internal use only. You can use a maximum of two processes.
Step 2	Do one of the following to configure optional OSPF NSSA parameters:	

Command	Purpose
area <i>area-id</i> nssa [no-redistribution] [default-information-originate] Example: hostname(config-router)# area 0 nssa	Defines an NSSA area.
summary-address <i>ip_address mask</i> [not-advertise] [tag tag] Example: hostname(config)# router ospf 1 hostname(config-router)# summary-address 10.1.0.0 255.255.0.0	Sets the summary address and helps reduce the size of the routing table. Using this command for OSPF causes an OSPF ASBR to advertise one external route as an aggregate for all redistributed routes that are covered by the address. In this example, the summary address 10.1.0.0 includes addresses 10.1.1.0, 10.1.2.0, 10.1.3.0, and so on. Only the 10.1.0.0 address is advertised in an external link-state advertisement.

**Note**

OSPF does not support summary-address 0.0.0.0 0.0.0.0.

Defining Static OSPF Neighbors

You need to define static OSPF neighbors to advertise OSPF routes over a point-to-point, non-broadcast network. This feature lets you broadcast OSPF advertisements across an existing VPN connection without having to encapsulate the advertisements in a GRE tunnel.

Before you begin, you must create a static route to the OSPF neighbor. See [Chapter 22, “Configuring Static and Default Routes,”](#) for more information about creating static routes.

To define a static OSPF neighbor, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router ospf <i>process_id</i> Example: hostname(config)# router ospf 2	Creates an OSPF routing process and enters router configuration mode for this OSPF process. The <i>process_id</i> argument is an internally used identifier for this routing process and can be any positive integer. This ID does not have to match the ID on any other device; it is for internal use only. You can use a maximum of two processes.
Step 2	neighbor <i>addr</i> [interface <i>if_name</i>] Example: hostname(config-router)# neighbor 255.255.0.0 [interface my_interface]	Defines the OSPF neighborhood. The <i>addr</i> argument is the IP address of the OSPF neighbor. The <i>if_name</i> argument is the interface used to communicate with the neighbor. If the OSPF neighbor is not on the same network as any of the directly connected interfaces, you must specify the interface.

Configuring Route Calculation Timers

You can configure the delay time between when OSPF receives a topology change and when it starts an SPF calculation. You also can configure the hold time between two consecutive SPF calculations.

To configure route calculation timers, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router ospf <i>process_id</i> Example: hostname(config)# router ospf 2	Creates an OSPF routing process and enters router configuration mode for this OSPF process. The <i>process_id</i> argument is an internally used identifier for this routing process and can be any positive integer. This ID does not have to match the ID on any other device; it is for internal use only. You can use a maximum of two processes.
Step 2	timers spf <i>spf-delay</i> <i>spf-holdtime</i> Example: hostname(config-router)# timers spf 10 120	Configures the route calculation times. The <i>spf-delay</i> argument is the delay time (in seconds) between when OSPF receives a topology change and when it starts an SPF calculation. It can be an integer from 0 to 65535. The default time is 5 seconds. A value of 0 means that there is no delay; that is, the SPF calculation is started immediately. The <i>spf-holdtime</i> argument is the minimum time (in seconds) between two consecutive SPF calculations. It can be an integer from 0 to 65535. The default time is 10 seconds. A value of 0 means that there is no delay; that is, two SPF calculations can be performed, one immediately after the other.

Logging Neighbors Going Up or Down

By default, a syslog message is generated when an OSPF neighbor goes up or down.

Configure **log-adj-changes** router configuration command if you want to know about OSPF neighbors going up or down without turning on the **debug ospf adjacency** command. The **log-adj-changes** router configuration command provides a higher level view of the peer relationship with less output. Configure the **log-adj-changes detail** command if you want to see messages for each state change.

To log neighbors going up or down, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router ospf <i>process_id</i>	Creates an OSPF routing process and enters router configuration mode for this OSPF process.
	Example: hostname(config)# router ospf 2	The <i>process_id</i> argument is an internally used identifier for this routing process and can be any positive integer. This ID does not have to match the ID on any other device; it is for internal use only. You can use a maximum of two processes.
Step 2	log-adj-changes [detail]	Configures logging for neighbors going up or down.
	Example: hostname(config-router)# log-adj-changes [detail]	

Restarting the OSPF Process

To remove the entire OSPF configuration that you have enabled, enter the following command:

Command	Purpose
clear ospf <i>pid</i> { process redistribution counters [neighbor [<i>neighbor-interface</i>] [<i>neighbor-id</i>]]}	Removes the entire OSPF configuration that you have enabled. After the configuration is cleared, you must reconfigure OSPF using the router ospf command.
Example: hostname(config)# clear ospf	

Configuration Example for OSPF

The following example shows how to enable and configure OSPF with various optional processes:

-
- Step 1** To enable OSPF, enter the following commands:
- ```
hostname(config)# router ospf 2
hostname(config-router)# network 10.0.0.0 255.0.0.0 area 0
```
- Step 2** (Optional) To redistribute routes from one OSPF process to another OSPF process, enter the following commands:
- ```
hostname(config)# route-map 1-to-2 permit
hostname(config-route-map)# match metric 1
hostname(config-route-map)# set metric 5
hostname(config-route-map)# set metric-type type-1
hostname(config-route-map)# router ospf 2
hostname(config-router)# redistribute ospf 1 route-map 1-to-2
```

Step 3 (Optional) To configure OSPF interface parameters, enter the following commands:

```
hostname(config)# router ospf 2
hostname(config-router)# network 10.0.0.0 255.0.0.0 area 0
hostname(config-router)# interface inside
hostname(config-interface)# ospf cost 20
hostname(config-interface)# ospf retransmit-interval 15
hostname(config-interface)# ospf transmit-delay 10
hostname(config-interface)# ospf priority 20
hostname(config-interface)# ospf hello-interval 10
hostname(config-interface)# ospf dead-interval 40
hostname(config-interface)# ospf authentication-key cisco
hostname(config-interface)# ospf message-digest-key 1 md5 cisco
hostname(config-interface)# ospf authentication message-digest
```

Step 4 (Optional) To configure OSPF area parameters, enter the following commands:

```
hostname(config)# router ospf 2
hostname(config-router)# area 0 authentication
hostname(config-router)# area 0 authentication message-digest
hostname(config-router)# area 17 stub
hostname(config-router)# area 17 default-cost 20
```

Step 5 (Optional) To configure the route calculation timers and show the log neighbor up and down messages, enter the following commands:

```
hostname(config-router)# timers spf 10 120
hostname(config-router)# log-adj-changes [detail]
```

Step 6 To restart the OSPF process, enter the following commands:

```
hostname(config)# clear ospf pid {process | redistribution | counters
[neighbor [neighbor-interface] [neighbor-id]]}
```

Step 7 (Optional) To show current OSPF configuration settings, enter the **show ospf** command.

The following is sample output from the **show ospf** command:

```
hostname(config)# show ospf

Routing Process "ospf 2" with ID 10.1.89.2 and Domain ID 0.0.0.2
Supports only single TOS(TOS0) routes
Supports opaque LSA
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
Number of external LSA 5. Checksum Sum 0x 26da6
Number of opaque AS LSA 0. Checksum Sum 0x      0
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
External flood list length 0
  Area BACKBONE(0)
    Number of interfaces in this area is 1
    Area has no authentication
    SPF algorithm executed 2 times
    Area ranges are
    Number of LSA 5. Checksum Sum 0x 209a3
    Number of opaque link LSA 0. Checksum Sum 0x      0
    Number of DCbitless LSA 0
    Number of indication LSA 0
    Number of DoNotAge LSA 0
    Flood list length 0
```

Monitoring OSPF

You can display specific statistics such as the contents of IP routing tables, caches, and databases. You can also use the information provided to determine resource utilization and solve network problems. You can also display information about node reachability and discover the routing path that your device packets are taking through the network.

To monitor or display various OSPF routing statistics, enter one of the following commands:

Command	Purpose
show ospf [<i>process-id</i> [<i>area-id</i>]]	Displays general information about OSPF routing processes.
show ospf border-routers	Displays the internal OSPF routing table entries to the ABR and ASBR.
show ospf [<i>process-id</i> [<i>area-id</i>]] database	Displays lists of information related to the OSPF database for a specific router.
show ospf flood-list <i>if-name</i>	Displays a list of LSAs waiting to be flooded over an interface (to observe OSPF packet pacing). OSPF update packets are automatically paced so they are not sent less than 33 milliseconds apart. Without pacing, some update packets could get lost in situations where the link is slow, a neighbor could not receive the updates quickly enough, or the router could run out of buffer space. For example, without pacing, packets might be dropped if either of the following topologies exist: • A fast router is connected to a slower router over a point-to-point link. • During flooding, several neighbors send updates to a single router at the same time. Pacing is also used between resends to increase efficiency and minimize lost retransmissions. You also can display the LSAs waiting to be sent out of an interface. Pacing enables OSPF update and retransmission packets to be sent more efficiently. There are no configuration tasks for this feature; it occurs automatically.
show ospf interface [<i>if_name</i>]	Displays OSPF-related interface information.
show ospf neighbor [<i>interface-name</i>] [<i>neighbor-id</i>] [detail]	Displays OSPF neighbor information on a per-interface basis.
show ospf request-list <i>neighbor if_name</i>	Displays a list of all LSAs requested by a router.
show ospf retransmission-list <i>neighbor if_name</i>	Displays a list of all LSAs waiting to be resent.

Command	Purpose
<code>show ospf [process-id] summary-address</code>	Displays a list of all summary address redistribution information configured under an OSPF process.
<code>show ospf [process-id] virtual-links</code>	Displays OSPF-related virtual links information.

Feature History for OSPF

Table 24-1 lists each feature change and the platform release in which it was implemented.

Table 24-1 Feature History for Static and Default Routes

Feature Name	Platform Releases	Feature Information
OSPF support	7.0(1)	Support was added for route data, authentication, and redistribution and monitoring of routing information using the Open Shortest Path First (OSPF) routing protocol. We introduced the route ospf command.

CHAPTER 25

Configuring RIP

This chapter describes how to configure the ASA to route data, perform authentication, and redistribute routing information, using the Routing Information Protocol (RIP).

The chapter includes the following sections:

- [Information About RIP, page 25-1](#)
- [Licensing Requirements for RIP, page 25-3](#)
- [Guidelines and Limitations, page 25-3](#)
- [Configuring RIP, page 25-4](#)
- [Customizing RIP, page 25-4](#)
- [Monitoring RIP, page 25-11](#)
- [Configuration Example for RIP, page 25-11](#)
- [Feature History for RIP, page 25-11](#)

Information About RIP

This section includes the following topics:

- [Routing Update Process, page 25-2](#)
- [RIP Routing Metric, page 25-2](#)
- [RIP Stability Features, page 25-2](#)
- [RIP Timers, page 25-2](#)

The Routing Information Protocol, or RIP, as it is more commonly called, is one of the most enduring of all routing protocols. RIP has four basic components: routing update process, RIP routing metrics, routing stability, and routing timers. Devices that support RIP send routing-update messages at regular intervals and when the network topology changes. These RIP packets include information about the networks that the devices can reach, as well as the number of routers or gateways that a packet must travel through to reach the destination address. RIP generates more traffic than OSPF, but is easier to configure.

RIP is a distance-vector routing protocol that uses hop count as the metric for path selection. When RIP is enabled on an interface, the interface exchanges RIP broadcasts with neighboring devices to dynamically learn about and advertise routes.

The ASA supports both RIP Version 1 and RIP Version 2. RIP Version 1 does not send the subnet mask with the routing update. RIP Version 2 sends the subnet mask with the routing update and supports variable-length subnet masks. Additionally, RIP Version 2 supports neighbor authentication when routing updates are exchanged. This authentication ensures that the ASA receives reliable routing information from a trusted source.

RIP has advantages over static routes because the initial configuration is simple, and you do not need to update the configuration when the topology changes. The disadvantage to RIP is that there is more network and processing overhead than in static routing.

Routing Update Process

RIP sends routing-update messages at regular intervals and when the network topology changes. When a router receives a routing update that includes changes to an entry, it updates its routing table to reflect the new route. The metric value for the path is increased by 1, and the sender is indicated as the next hop. RIP routers maintain only the best route (the route with the lowest metric value) to a destination. After updating its routing table, the router immediately begins transmitting routing updates to inform other network routers of the change. These updates are sent independently of the regularly scheduled updates that RIP routers send.

RIP Routing Metric

RIP uses a single routing metric (hop count) to measure the distance between the source and a destination network. Each hop in a path from source to destination is assigned a hop count value, which is typically 1. When a router receives a routing update that contains a new or changed destination network entry, the router adds 1 to the metric value indicated in the update and enters the network in the routing table. The IP address of the sender is used as the next hop.

RIP Stability Features

RIP prevents routing loops from continuing indefinitely by implementing a limit on the number of hops allowed in a path from the source to a destination. The maximum number of hops in a path is 15. If a router receives a routing update that contains a new or changed entry, and if increasing the metric value by 1 causes the metric to be infinity (that is, 16), the network destination is considered unreachable. The downside of this stability feature is that it limits the maximum diameter of a RIP network to less than 16 hops.

RIP includes a number of other stability features that are common to many routing protocols. These features are designed to provide stability despite potentially rapid changes in network topology. For example, RIP implements the split horizon and hold-down mechanisms to prevent incorrect routing information from being propagated.

RIP Timers

RIP uses numerous timers to regulate its performance. These include a routing-update timer, a route-timeout timer, and a route-flush timer. The routing-update timer clocks the interval between periodic routing updates. Generally, it is set to 30 seconds, with a small random amount of time added whenever the timer is reset. This is done to help prevent congestion, which could result from all routers

simultaneously attempting to update their neighbors. Each routing table entry has a route-timeout timer associated with it. When the route-timeout timer expires, the route is marked invalid but is retained in the table until the route-flush timer expires.

Licensing Requirements for RIP

The following table shows the licensing requirements for this feature:

Model	License Requirement
All models	Base License.

Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

Context Mode Guidelines

Supported in single context mode only.

Firewall Mode Guidelines

Supported in routed and transparent firewall mode.

IPv6 Guidelines

Does not support IPv6.

Additional Guidelines

The following information applies to RIP Version 2 only:

- If using neighbor authentication, the authentication key and key ID must be the same on all neighbor devices that provide RIP Version 2 updates to the interface.
- With RIP Version 2, the ASA transmits and receives default route updates using the multicast address 224.0.0.9. In passive mode, it receives route updates at that address.
- When RIP Version 2 is configured on an interface, the multicast address 224.0.0.9 is registered on that interface. When a RIP Version 2 configuration is removed from an interface, that multicast address is unregistered.

Limitations

- The ASA cannot pass RIP updates between interfaces.
- RIP Version 1 does not support variable-length subnet masks.
- RIP has a maximum hop count of 15. A route with a hop count greater than 15 is considered unreachable.
- RIP convergence is relatively slow compared to other routing protocols.
- You can only enable a single RIP process on the ASA.

Configuring RIP

This section describes how to enable and restart the RIP process on the ASA.

After you have enabled RIP, see the [“Customizing RIP” section on page 25-4](#), to learn how to customize the RIP process on the ASA.

Note

If you want to redistribute a route by defining which of the routes from the specified routing protocol are allowed to be redistributed into the target routing process, you must first generate a default route. For information, see the [“Configuring a Default Static Route” section on page 22-4](#) and then define a route map. For information, see the [“Defining a Route Map” section on page 23-4](#).

Enabling RIP

You can only enable one RIP routing process on the ASA. After you enable the RIP routing process, you must define the interfaces that will participate in that routing process using the **network** command. By default, the ASA sends RIP Version 1 updates and accepts RIP Version 1 and Version 2 updates.

To enable the RIP routing process, enter the following command:

Command	Purpose
<code>router rip</code>	Starts the RIP routing process and places you in router configuration mode.
Example: <code>hostname(config)# router rip</code>	Use the no router rip command to remove the entire RIP configuration that you have enabled. After the configuration is cleared, you must reconfigure RIP using the router rip command.

Customizing RIP

- This section describes how to configure RIP and includes the following topics:
- [Configuring the RIP Version, page 25-5](#)
 - [Configuring Interfaces for RIP, page 25-6](#)
 - [Configuring the RIP Send and Receive Version on an Interface, page 25-6](#)
 - [Configuring Route Summarization, page 25-7](#)
 - [Filtering Networks in RIP, page 25-8](#)
 - [Redistributing Routes into the RIP Routing Process, page 25-8](#)
 - [Enabling RIP Authentication, page 25-9](#)
 - [Restarting the RIP Process, page 25-10](#)

Configuring the RIP Version

To specify the version of RIP used by the ASA, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router rip Example: hostname(config)# router rip	Starts the RIP routing process and places you in router configuration mode.
Step 2	network network_address Example: hostname(config)# router rip hostname(config-router)# network 10.0.0.0	Specifies the interfaces that will participate in the RIP routing process. If an interface belongs to a network defined by this command, the interface will participate in the RIP routing process. If an interface does not belong to a network defined by this command, the interface will not send or receive RIP updates.
Step 3	Enter one of the following numbers to customize an interface to participate in RIP routing: version [1 2] Example: hostname(config-router)# version [1]	Specifies the version of RIP used by the ASA. You can override this setting on a per-interface basis. In this example, Version 1 is entered.

Configuring Interfaces for RIP

If you have an interface that you do not want to have participate in RIP routing, but that is attached to a network that you want advertised, you can configure the network (using the **network** command) that includes the network to which the interface is attached, and configure the passive interfaces (using the **passive-interface** command) to prevent that interface from using RIP. Additionally, you can specify the version of RIP that is used by the ASA for updates.

To configure interfaces for RIP, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router rip Example: hostname(config)# router rip	Starts the RIP routing process and places you in router configuration mode.
Step 2	network network_address Example: hostname(config)# router rip hostname(config-router)# network 10.0.0.0	Specifies the interfaces that will participate in the RIP routing process. If an interface belongs to a network defined by this command, the interface will participate in the RIP routing process. If an interface does not belong to a network defined by this command, it will not send or receive RIP updates.
Step 3	passive-interface [default if_name] Example: hostname(config-router)# passive-interface [default]	Specifies an interface to operate in passive mode. Using the default keyword causes all interfaces to operate in passive mode. Specifying an interface name sets only that interface to passive mode. In passive mode, RIP routing updates are accepted by, but not sent out of, the specified interface. You can enter this command for each interface that you want to set to passive mode.

Configuring the RIP Send and Receive Version on an Interface

You can override the globally-set version of RIP that the ASA uses to send and receive RIP updates on a per-interface basis.

To configure the RIP version for sending and receiving updates, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	interface phy_if Example: hostname(config)# interface phy_if	Enters interface configuration mode for the interface that you are configuring.
Step 2	Do one of the following to send or receive RIP updates on a per-interface basis.	

Command	Purpose
rip send version {[1] [2]} Example: hostname(config-if)# rip send version 1	Specifies the version of RIP to use when sending RIP updates out of the interface. In this example, Version 1 is selected.
rip receive version {[1] [2]} Example: hostname(config-if)# rip receive version 2	Specifies the version of RIP advertisements permitted to be received by an interface. In this example, Version 2 is selected. RIP updates received on the interface that do not match the allowed version are dropped.

Configuring Route Summarization

Note

RIP Version 1 always uses automatic route summarization. You cannot disable this feature for RIP Version 1. RIP Version 2 uses automatic route summarization by default.

The RIP routing process summarizes on network number boundaries, which can cause routing problems if you have noncontiguous networks.

For example, if you have a router with the networks 192.168.1.0, 192.168.2.0, and 192.168.3.0 connected to it, and those networks all participate in RIP, the RIP routing process creates the summary address 192.168.0.0 for those routes. If an additional router is added to the network with the networks 192.168.10.0 and 192.168.11.0, and those networks participate in RIP, they will also be summarized as 192.168.0.0. To prevent the possibility of traffic being routed to the wrong location, you should disable automatic route summarization on the routers that are creating conflicting summary addresses.

Because RIP Version 1 always uses automatic route summarization, and RIP Version 2 always uses automatic route summarization by default, when configuring automatic route summarization, you only need to disable it.

To disable automatic route summarization, enter the following command:

Detailed Steps

	Command	Purpose
Step 1	router rip Example: hostname(config)# router rip	Enables the RIP routing process and places you in router configuration mode.
Step 2	no auto-summarize Example: hostname(config-router):# no auto-summarize	Disables automatic route summarization.

Filtering Networks in RIP

To filter the networks received in updates, perform the following steps:

**Note**

Before you begin, you must create a standard access list that permits the networks that you want the RIP process to allow in the routing table and denies the networks that you want the RIP process to discard.

Detailed Steps

	Command	Purpose
Step 1	router rip Example: hostname(config)# router rip	Enables the RIP routing process and places you in router configuration mode.
Step 2	distribute-list acl in [interface if_name] distribute-list acl out [connected eigrp interface if_name ospf rip static] Example: hostname(config-router)# distribute-list acl2 in [interface interface1] hostname(config-router)# distribute-list acl3 out [connected]	Filters the networks sent in updates. You can specify an interface to apply the filter to only those updates that are received or sent by that interface. You can enter this command for each interface to which you want to apply a filter. If you do not specify an interface name, the filter is applied to all RIP updates.

Redistributing Routes into the RIP Routing Process

You can redistribute routes from the OSPF, EIGRP, static, and connected routing processes into the RIP routing process.

**Note**

Before you begin this procedure, you must create a route map to further define which routes from the specified routing protocol are redistributed in to the RIP routing process. See [Chapter 23, “Defining a Route Map,”](#) for more information about creating a route map.

To redistribute a route into the RIP routing process, enter one of the following commands:

Command	Purpose
Choose one of the following commands to redistribute the selected route type into the RIP routing process. You must specify the RIP metric values in the redistribute command if you do not have a default-metric command in the RIP router configuration.	
redistribute connected [metric <i>metric-value</i> transparent] [route-map <i>route-map-name</i>] Example: <pre>hostname(config-router): # redistribute connected [metric metric-value transparent] [route-map route-map-name]</pre>	Redistributes connected routes into the RIP routing process.
redistribute static [metric { <i>metric_value</i> transparent }] [route-map <i>map_name</i>] Example: <pre>hostname(config-router):# redistribute static [metric {metric_value transparent}] [route-map map_name]</pre>	Redistributes static routes into the EIGRP routing process.
redistribute ospf <i>pid</i> [match { internal external [1 2] nssa-external [1 2]}] [metric { <i>metric_value</i> transparent }] [route-map <i>map_name</i>] Example: <pre>hostname(config-router):# redistribute ospf pid [match {internal external [1 2] nssa-external [1 2]}] [metric {metric_value transparent}] [route-map map_name]</pre>	Redistributes routes from an OSPF routing process into the RIP routing process.
redistribute eigrp <i>as-num</i> [metric { <i>metric_value</i> transparent }] [route-map <i>map_name</i>] Example: <pre>hostname(config-router):# redistribute eigrp as-num [metric {metric_value transparent}] [route-map map_name]</pre>	Redistributes routes from an EIGRP routing process into the RIP routing process.

Enabling RIP Authentication

Note

The ASA supports RIP message authentication for RIP Version 2 messages.

RIP route authentication provides MD5 authentication of routing updates from the RIP routing protocol. The MD5 keyed digest in each RIP packet prevents the introduction of unauthorized or false routing messages from unapproved sources.

RIP route authentication is configured on a per-interface basis. All RIP neighbors on interfaces configured for RIP message authentication must be configured with the same authentication mode and key for adjacencies to be established.

**Note**

Before you can enable RIP route authentication, you must enable RIP.

To enable RIP authentication on an interface, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router rip <i>as-num</i> Example: hostname(config)# router rip 2	Creates the RIP routing process and enters router configuration mode for this RIP process. The <i>as-num</i> argument is the autonomous system number of the RIP routing process.
Step 2	interface <i>phy_if</i> Example: hostname(config)# interface <i>phy_if</i>	Enters interface configuration mode for the interface on which you are configuring RIP message authentication.
Step 3	rip authentication mode { text md5 } Example: hostname(config-if)# rip authentication mode md5	Sets the authentication mode. By default, text authentication is used. We recommend that you use MD5 authentication.
Step 4	rip authentication key <i>key</i> key-id <i>key-id</i> Example: hostname(config-if)# rip authentication key cisco key-id 200	Configures the authentication key used by the MD5 algorithm. The <i>key</i> argument can include up to 16 characters. The <i>key-id</i> argument is a number from 0 to 255.

Restarting the RIP Process

To remove the entire RIP configuration, enter the following command:

Command	Purpose
clear rip <i>pid</i> { process redistribution counters [neighbor [<i>neighbor-interface</i>] [<i>neighbor-id</i>]]} Example: hostname(config)# clear rip	Removes the entire RIP configuration that you have enabled. After the configuration is cleared, you must reconfigure RIP again using the router rip command.

Monitoring RIP

We recommend that you only use the **debug** commands to troubleshoot specific problems or during troubleshooting sessions with the Cisco TAC.

Debugging output is assigned high priority in the CPU process and can render the ASA unusable. It is best to use **debug** commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased **debug** command processing overhead will affect performance. For examples and descriptions of the command output, see the *Cisco ASA 5500 Series Command Reference*.

To monitor or debug various RIP routing statistics, enter one of the following commands:

Command	Purpose
Monitoring RIP Routing	
show rip database	Display the contents of the RIP routing database.
show running-config router rip	Displays the RIP commands.
Debugging RIP	
debug rip events	Displays RIP processing events.
debug rip database	Displays RIP database events.

Configuration Example for RIP

The following example shows how to enable and configure RIP with various optional processes:

```
hostname(config)# router rip 2
hostname(config-router)# default-information originate
hostname(config-router)# version [1]
hostname(config-router)# network 225.25.25.225
hostname(config-router)# passive-interface [default]
hostname(config-router)# redistribute connected [metric bandwidth delay reliability
loading mtu] [route-map map_name]
```

Feature History for RIP

Table 25-1 lists each feature change and the platform release in which it was implemented.

Table 25-1 Feature History for RIP

Feature Name	Releases	Feature Information
RIP support	7.0(1)	Support was added for routing data, performing authentication, and redistributing and monitoring routing information using the Routing Information Protocol (RIP). We introduced the route rip command.

CHAPTER 26

Configuring Multicast Routing

This chapter describes how to configure the ASA to use the multicast routing protocol and includes the following sections:

- [Information About Multicast Routing, page 26-1](#)
- [Licensing Requirements for Multicast Routing, page 26-2](#)
- [Guidelines and Limitations, page 26-3](#)
- [Enabling Multicast Routing, page 26-3](#)
- [Customizing Multicast Routing, page 26-4](#)
- [Configuration Example for Multicast Routing, page 26-14](#)
- [Additional References, page 26-15](#)
- [Feature History for Multicast Routing, page 26-15](#)

Information About Multicast Routing

Multicast routing is a bandwidth-conserving technology that reduces traffic by simultaneously delivering a single stream of information to thousands of corporate recipients and homes. Applications that take advantage of multicast routing include videoconferencing, corporate communications, distance learning, and distribution of software, stock quotes, and news.

Multicast routing protocols deliver source traffic to multiple receivers without adding any additional burden on the source or the receivers while using the least network bandwidth of any competing technology. Multicast packets are replicated in the network by Cisco routers enabled with Protocol Independent Multicast (PIM) and other supporting multicast protocols resulting in the most efficient delivery of data to multiple receivers possible.

The ASA supports both stub multicast routing and PIM multicast routing. However, you cannot configure both concurrently on a single ASA.

Note

The UDP and non-UDP transports are both supported for multicast routing. However, the non-UDP transport has no FastPath optimization.

This section includes the following topics:

- [Stub Multicast Routing, page 26-2](#)
- [PIM Multicast Routing, page 26-2](#)

- [Multicast Group Concept, page 26-2](#)

Stub Multicast Routing

Stub multicast routing provides dynamic host registration and facilitates multicast routing. When configured for stub multicast routing, the ASA acts as an IGMP proxy agent. Instead of fully participating in multicast routing, the ASA forwards IGMP messages to an upstream multicast router, which sets up delivery of the multicast data. When configured for stub multicast routing, the ASA cannot be configured for PIM.

The ASA supports both PIM-SM and bidirectional PIM. PIM-SM is a multicast routing protocol that uses the underlying unicast routing information base or a separate multicast-capable routing information base. It builds unidirectional shared trees rooted at a single Rendezvous Point per multicast group and optionally creates shortest-path trees per multicast source.

PIM Multicast Routing

Bi-directional PIM is a variant of PIM-SM that builds bi-directional shared trees connecting multicast sources and receivers. Bi-directional trees are built using a DF election process operating on each link of the multicast topology. With the assistance of the DF, multicast data is forwarded from sources to the Rendezvous Point, and therefore along the shared tree to receivers, without requiring source-specific state. The DF election takes place during Rendezvous Point discovery and provides a default route to the Rendezvous Point.

**Note**

If the ASA is the PIM RP, use the untranslated outside address of the ASA as the RP address.

Multicast Group Concept

Multicast is based on the concept of a group. An arbitrary group of receivers expresses an interest in receiving a particular data stream. This group does not have any physical or geographical boundaries—the hosts can be located anywhere on the Internet. Hosts that are interested in receiving data flowing to a particular group must join the group using IGMP. Hosts must be a member of the group to receive the data stream.

Multicast Addresses

Multicast addresses specify an arbitrary group of IP hosts that have joined the group and want to receive traffic sent to this group.

Licensing Requirements for Multicast Routing

The following table shows the licensing requirements for this feature:

Model	License Requirement
All models	Base License.

Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

Context Mode Guidelines

Supported in single context mode. In multiple context mode, unshared interfaces and shared interfaces are not supported.

Firewall Mode Guidelines

Supported only in routed firewall mode. Transparent firewall mode is not supported.

IPv6 Guidelines

Does not support IPv6.

Enabling Multicast Routing

Enabling multicast routing lets you enable multicast routing on the ASA. Enabling multicast routing enables IGMP and PIM on all interfaces by default. IGMP is used to learn whether members of a group are present on directly attached subnets. Hosts join multicast groups by sending IGMP report messages. PIM is used to maintain forwarding tables to forward multicast datagrams.

Note

Only the UDP transport layer is supported for multicast routing.

To enable multicast routing, enter the following command:

Command	Purpose
multicast-routing	Enables multicast routing.
Example: hostname(config)# multicast-routing	The number of entries in the multicast routing tables are limited by the amount of RAM on the ASA.

Table 26-1 lists the maximum number of entries for specific multicast tables based on the amount of RAM on the ASA. Once these limits are reached, any new entries are discarded.

Table 26-1 Entry Limits for Multicast Tables

Table	16 MB	128 MB	128+ MB
MFIB	1000	3000	5000
IGMP Groups	1000	3000	5000
PIM Routes	3000	7000	12000

Customizing Multicast Routing

This section describes how to customize multicast routing and includes the following topics:

- [Configuring Stub Multicast Routing and Forwarding IGMP Messages, page 26-4](#)
- [Configuring a Static Multicast Route, page 26-4](#)
- [Configuring IGMP Features, page 26-5](#)
- [Configuring PIM Features, page 26-9](#)
- [Configuring a Bidirectional Neighbor Filter, page 26-13](#)
- [Configuring a Multicast Boundary, page 26-14](#)

Configuring Stub Multicast Routing and Forwarding IGMP Messages

**Note**

Stub multicast routing and PIM are not supported concurrently.

An ASA acting as the gateway to the stub area does not need to participate in PIM. Instead, you can configure it to act as an IGMP proxy agent and forward IGMP messages from hosts connected on one interface to an upstream multicast router on another interface. To configure the ASA as an IGMP proxy agent, forward the host join and leave messages from the stub area interface to an upstream interface.

To forward the host join and leave messages, enter the following command from the interface attached to the stub area:

Command	Purpose
<code>igmp forward interface <i>if_name</i></code>	Configures stub multicast routing and forwards IGMP messages.
Example: <code>hostname(config-if)# igmp forward interface <i>interface1</i></code>	

Configuring a Static Multicast Route

Configuring static multicast routes lets you separate multicast traffic from unicast traffic. For example, when a path between a source and destination does not support multicast routing, the solution is to configure two multicast devices with a GRE tunnel between them and to send the multicast packets over the tunnel.

When using PIM, the ASA expects to receive packets on the same interface where it sends unicast packets back to the source. In some cases, such as bypassing a route that does not support multicast routing, you may want unicast packets to take one path and multicast packets to take another.

Static multicast routes are not advertised or redistributed.

To configure a static multicast route or a static multicast route for a stub area, enter one of the following commands:

Command	Purpose
mroute <i>src_ip src_mask {input_if_name rpf_neighbor} [distance]</i> Example: hostname(config)# mroute <i>src_ip src_mask {input_if_name rpf_neighbor} [distance]</i>	Configures a static multicast route.
mroute <i>src_ip src_mask input_if_name [dense output_if_name] [distance]</i> Example: hostname(config)# mroute <i>src_ip src_mask input_if_name [dense output_if_name] [distance]</i>	Configures a static multicast route for a stub area. The dense output_if_name keyword and argument pair is only supported for stub multicast routing.

Configuring IGMP Features

IP hosts use the Internet Group Management Protocol (IGMP) to report their group memberships to directly connected multicast routers.

IGMP is used to dynamically register individual hosts in a multicast group on a particular LAN. Hosts identify group memberships by sending IGMP messages to their local multicast router. Under IGMP, routers listen to IGMP messages and periodically send out queries to discover which groups are active or inactive on a particular subnet.

IGMP uses group addresses (Class D IP address) as group identifiers. Host group address can be in the range of 224.0.0.0 to 239.255.255.255. The address 224.0.0.0 is never assigned to any group. The address 224.0.0.1 is assigned to all systems on a subnet. The address 224.0.0.2 is assigned to all routers on a subnet.

When you enable multicast routing on the ASA, IGMP Version 2 is automatically enabled on all interfaces.

Note

Only the **no igmp** command appears in the interface configuration when you use the **show run** command. If the **multicast-routing** command appears in the device configuration, then IGMP is automatically enabled on all interfaces.

This section describes how to configure optional IGMP setting on a per-interface basis and includes the following topics:

- [Disabling IGMP on an Interface, page 26-6](#)
- [Configuring IGMP Group Membership, page 26-6](#)
- [Configuring a Statically Joined IGMP Group, page 26-6](#)
- [Controlling Access to Multicast Groups, page 26-7](#)
- [Limiting the Number of IGMP States on an Interface, page 26-7](#)
- [Modifying the Query Messages to Multicast Groups, page 26-8](#)
- [Changing the IGMP Version, page 26-9](#)

Disabling IGMP on an Interface

You can disable IGMP on specific interfaces. This information is useful if you know that there are no multicast hosts on a specific interface and you want to prevent the ASA from sending host query messages on that interface.

To disable IGMP on an interface, enter the following command:

Command	Purpose
<code>no igmp</code>	Disables IGMP on an interface. To reenable IGMP on an interface, use the igmp command.
Example: <code>hostname(config-if)# no igmp</code>	

**Note**

Only the **no igmp** command appears in the interface configuration.

Configuring IGMP Group Membership

You can configure the ASA to be a member of a multicast group. Configuring the ASA to join a multicast group causes upstream routers to maintain multicast routing table information for that group and keep the paths for that group active.

**Note**

If you want to forward multicast packets for a specific group to an interface without the ASA accepting those packets as part of the group, see the [“Configuring a Statically Joined IGMP Group”](#) section on [page 26-6](#).

To have the ASA join a multicast group, enter the following command:

Command	Purpose
<code>igmp join-group group-address</code>	Configures the ASA to be a member of a multicast group. The <i>group-address</i> argument is the IP address of the group.
Example: <code>hostname(config-if)# igmp join-group mcast-group</code>	

Configuring a Statically Joined IGMP Group

Sometimes a group member cannot report its membership in the group because of some configuration, or there may be no members of a group on the network segment. However, you still want multicast traffic for that group to be sent to that network segment. You can have multicast traffic for that group sent to the segment by configuring a statically joined IGMP group.

Enter the **igmp static-group** command. The ASA does not accept the multicast packets, but instead forwards them to the specified interface.

To configure a statically joined multicast group on an interface, enter the following command:

Command	Purpose
igmp static-group	Configures the ASA statically to join a multicast group on an interface.
Example: hostname(config-if)# igmp static-group <i>group-address</i>	The <i>group-address</i> argument is the IP address of the group.

Controlling Access to Multicast Groups

To control the multicast groups that hosts on the ASA interface can join, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	Do one of the following to create a standard or extended access list:	
	access-list <i>name</i> standard [permit deny] <i>ip_addr mask</i>	Creates a standard access list for the multicast traffic. You can create more than one entry for a single access list. You can use extended or standard access lists. The <i>ip_addr mask</i> argument is the IP address of the multicast group being permitted or denied.
	Example: hostname(config)# access-list <i>acl1</i> standard permit 192.52.662.25	
	access-list <i>name</i> extended [permit deny] <i>protocol src_ip_addr src_mask dst_ip_addr</i> <i>dst_mask</i>	Creates an extended access list. The <i>dst_ip_addr</i> argument is the IP address of the multicast group being permitted or denied.
	Example: hostname(config)# access-list <i>acl2</i> extended permit <i>protocol</i> <i>src_ip_addr</i> <i>src_mask dst_ip_addr dst_mask</i>	
Step 2	igmp access-group <i>acl</i>	Applies the access list to an interface. The <i>acl</i> argument is the name of a standard or extended IP access list.
	Example: hostname(config-if)# igmp access-group <i>acl</i>	

Limiting the Number of IGMP States on an Interface

You can limit the number of IGMP states resulting from IGMP membership reports on a per-interface basis. Membership reports exceeding the configured limits are not entered in the IGMP cache, and traffic for the excess membership reports is not forwarded.

To limit the number of IGMP states on an interface, enter the following command:

Command	Purpose
igmp limit <i>number</i>	Limits the number of IGMP states on an interface.
Example: hostname(config-if)# igmp limit 50	Valid values range from 0 to 500, with 500 being the default value. Setting this value to 0 prevents learned groups from being added, but manually defined memberships (using the igmp join-group and igmp static-group commands) are still permitted. The no form of this command restores the default value.

Modifying the Query Messages to Multicast Groups

Note

The **igmp query-timeout** and **igmp query-interval** commands require IGMP Version 2.

The ASA sends query messages to discover which multicast groups have members on the networks attached to the interfaces. Members respond with IGMP report messages indicating that they want to receive multicast packets for specific groups. Query messages are addressed to the all-systems multicast group, which has an address of 224.0.0.1, with a time-to-live value of 1.

These messages are sent periodically to refresh the membership information stored on the ASA. If the ASA discovers that there are no local members of a multicast group still attached to an interface, it stops forwarding multicast packet for that group to the attached network, and it sends a prune message back to the source of the packets.

By default, the PIM designated router on the subnet is responsible for sending the query messages. By default, they are sent once every 125 seconds.

When changing the query response time, by default, the maximum query response time advertised in IGMP queries is 10 seconds. If the ASA does not receive a response to a host query within this amount of time, it deletes the group.

To change the query interval, query response time, and query timeout value, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	igmp query-interval <i>seconds</i>	Sets the query interval time in seconds.
	Example: hostname(config-if)# igmp query-interval 30	Valid values range from 0 to 500; 125 is the default value. If the ASA does not hear a query message on an interface for the specified timeout value (by default, 255 seconds), then the ASA becomes the designated router and starts sending the query messages.

	Command	Purpose
Step 2	igmp query-timeout <i>seconds</i> Example: hostname(config-if)# igmp query-timeout 30	Changes the timeout value of the query. Valid values range from 0 to 500; 225 is the default value.
Step 3	igmp query-max-response-time <i>seconds</i> Example: hostname(config-if)# igmp query-max-response-time 30	Changes the maximum query response time.

Changing the IGMP Version

By default, the ASA runs IGMP Version 2, which enables several additional features such as the **igmp query-timeout** and **igmp query-interval** commands.

All multicast routers on a subnet must support the same version of IGMP. The ASA does not automatically detect Version 1 routers and switch to Version 1. However, a mix of IGMP Version 1 and 2 hosts on the subnet works; the ASA running IGMP Version 2 works correctly when IGMP Version 1 hosts are present.

To control which version of IGMP is running on an interface, enter the following command:

Command	Purpose
igmp version {1 2} Example: hostname(config-if)# igmp version 2	Controls the version of IGMP that you want to run on the interface.

Configuring PIM Features

Routers use PIM to maintain forwarding tables for forwarding multicast diagrams. When you enable multicast routing on the ASA, PIM and IGMP are automatically enabled on all interfaces.

Note

PIM is not supported with PAT. The PIM protocol does not use ports, and PAT only works with protocols that use ports.

This section describes how to configure optional PIM settings and includes the following topics:

- [Enabling and Disabling PIM on an Interface, page 26-10](#)
- [Configuring a Static Rendezvous Point Address, page 26-10](#)
- [Configuring the Designated Router Priority, page 26-11](#)
- [Configuring and Filtering PIM Register Messages, page 26-11](#)
- [Configuring PIM Message Intervals, page 26-12](#)
- [Filtering PIM Neighbors, page 26-12](#)

Enabling and Disabling PIM on an Interface

You can enable or disable PIM on specific interfaces. To enable or disable PIM on an interface, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	pim Example: hostname(config-if)# pim	Enables or reenables PIM on a specific interface.
Step 2	no pim Example: hostname(config-if)# no pim	Disables PIM on a specific interface.

Note

Only the **no pim** command appears in the interface configuration.

Configuring a Static Rendezvous Point Address

All routers within a common PIM sparse mode or bidir domain require knowledge of the PIM RP address. The address is statically configured using the **pim rp-address** command.

Note

The ASA does not support Auto-RP or PIM BSR. You must use the **pim rp-address** command to specify the RP address.

You can configure the ASA to serve as RP to more than one group. The group range specified in the access list determines the PIM RP group mapping. If an access list is not specified, then the RP for the group is applied to the entire multicast group range (224.0.0.0/4).

To configure the address of the PIM PR, enter the following command:

Command	Purpose
pim rp-address <i>ip_address</i> [<i>acl</i>] [bidir] Example: hostname(config)# pim rp-address 10.86.75.23 [acl1] [bidir]	Enables or reenables PIM on a specific interface. The <i>ip_address</i> argument is the unicast IP address of the router assigned to be a PIM RP. The <i>acl</i> argument is the name or number of a standard access list that defines with which multicast groups the RP should be used. Do not use a host ACL with this command. Excluding the bidir keyword causes the groups to operate in PIM sparse mode.

**Note**

The ASA always advertises the bidirectional capability in the PIM hello messages, regardless of the actual bidirectional configuration.

Configuring the Designated Router Priority

The DR is responsible for sending PIM register, join, and prune messages to the RP. When there is more than one multicast router on a network segment, selecting the DR is based on the DR priority. If multiple devices have the same DR priority, then the device with the highest IP address becomes the DR.

By default, the ASA has a DR priority of 1. To change this value, enter the following command:

Command	Purpose
pim dr-priority <i>num</i>	Changes the designated router priority. The <i>num</i> argument can be any number ranging from 1 to 4294967294.
Example: hostname(config-if)# pim dr-priority 500	

Configuring and Filtering PIM Register Messages

When the ASA is acting as an RP, you can restrict specific multicast sources from registering with it to prevent unauthorized sources from registering with the RP. The Request Filter pane lets you define the multicast sources from which the ASA will accept PIM register messages.

To filter PIM register messages, enter the following command:

Command	Purpose
pim accept-register { <i>list acl</i> <i>route-map map-name</i> }	Configures the ASA to filter PIM register messages. In the example, the ASA filters PIM register messages <i>acl1</i> and route map <i>map2</i> .
Example: hostname(config)# pim accept-register { <i>list acl1</i> <i>route-map map2</i> }	

Configuring PIM Message Intervals

Router query messages are used to select the PIM DR. The PIM DR is responsible for sending router query messages. By default, router query messages are sent every 30 seconds. Additionally, every 60 seconds, the ASA sends PIM join or prune messages.

To change these intervals, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	pim hello-interval <i>seconds</i> Example: hostname(config-if)# pim hello-interval 60	Sends router query messages. Valid values for the <i>seconds</i> argument range from 1 to 3600 seconds.
Step 2	pim join-prune-interval <i>seconds</i> Example: hostname(config-if)# pim join-prune-interval 60	Changes the amount of time (in seconds) that the ASA sends PIM join or prune messages. Valid values for the <i>seconds</i> argument range from 10 to 600 seconds.

Filtering PIM Neighbors

You can define the routers that can become PIM neighbors. By filtering the routers that can become PIM neighbors, you can do the following:

- Prevent unauthorized routers from becoming PIM neighbors.
- Prevent attached stub routers from participating in PIM.

To define neighbors that can become a PIM neighbor, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	access-list pim_nbr deny <i>router-IP_addr</i> <i>PIM neighbor</i> Example: hostname(config)# access-list pim_nbr deny 10.1.1.1 255.255.255.255	Uses a standard access list to define the routers that you want to have participate in PIM. In the example, the following access list, when used with the pim neighbor-filter command, prevents the 10.1.1.1 router from becoming a PIM neighbor.
Step 2	pim neighbor-filter <i>pim_nbr</i> Example: hostname(config)# interface GigabitEthernet0/3 hostname(config-if)# pim neighbor-filter pim_nbr	Filters neighbor routers. In the example, the 10.1.1.1 router is prevented from becoming a PIM neighbor on interface GigabitEthernet0/3.

Configuring a Bidirectional Neighbor Filter

The Bidirectional Neighbor Filter pane shows the PIM bidirectional neighbor filters, if any, that are configured on the ASA. A PIM bidirectional neighbor filter is an ACL that defines the neighbor devices that can participate in the DF election. If a PIM bidirectional neighbor filter is not configured for an interface, then there are no restrictions. If a PIM bidirectional neighbor filter is configured, only those neighbors permitted by the ACL can participate in the DF election process.

When a PIM bidirectional neighbor filter configuration is applied to the ASA, an ACL appears in the running configuration with the name *interface-name_multicast*, in which the *interface-name* is the name of the interface to which the multicast boundary filter is applied. If an ACL with that name already exists, a number is appended to the name (for example, *inside_multicast_1*). This ACL defines which devices can become PIM neighbors of the ASA.

Bidirectional PIM allows multicast routers to keep reduced state information. All of the multicast routers in a segment must be bidirectionally enabled for *bidir* to elect a DF.

The PIM bidirectional neighbor filters enable the transition from a sparse-mode-only network to a *bidir* network by letting you specify the routers that should participate in the DF election, while still allowing all routers to participate in the sparse-mode domain. The *bidir*-enabled routers can elect a DF from among themselves, even when there are non-*bidir* routers on the segment. Multicast boundaries on the non-*bidir* routers prevent PIM messages and data from the *bidir* groups from leaking in or out of the *bidir* subset cloud.

When a PIM bidirectional neighbor filter is enabled, the routers that are permitted by the ACL are considered to be bidirectionally capable. Therefore, the following is true:

- If a permitted neighbor does not support *bidir*, then the DF election does not occur.
- If a denied neighbor supports *bidir*, then the DF election does not occur.
- If a denied neighbor does not support *bidir*, the DF election can occur.

To define the neighbors that can become a PIM bidirectional neighbor filter, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	access-list pim_nbr deny router-IP_addr PIM neighbor Example: hostname(config)# access-list pim_nbr deny 10.1.1.1 255.255.255.255	Uses a standard access list to define the routers that you want to have participate in PIM. In the example, the following access list, when used with the pim neighbor-filter command, prevents the 10.1.1.1 router from becoming a PIM neighbor.
Step 2	pim bidirectional-neighbor-filter pim_nbr Example: hostname(config)# interface GigabitEthernet0/3 hostname(config-if)# pim bidirectional neighbor-filter pim_nbr	Filters neighbor routers. In the example, the 10.1.1.1 router is prevented from becoming a PIM bidirectional neighbor on interface GigabitEthernet0/3.

Configuring a Multicast Boundary

Address scoping defines domain boundaries so that domains with RPs that have the same IP address do not leak into each other. Scoping is performed on the subnet boundaries within large domains and on the boundaries between the domain and the Internet.

You can set up an administratively scoped boundary on an interface for multicast group addresses by entering the **multicast boundary** command. IANA has designated the multicast address range from 239.0.0.0 to 239.255.255.255 as the administratively scoped addresses. This range of addresses can be reused in domains administered by different organizations. The addresses would be considered local, not globally unique.

A standard ACL defines the range of affected addresses. When a boundary is set up, no multicast data packets are allowed to flow across the boundary from either direction. The boundary allows the same multicast group address to be reused in different administrative domains.

You can configure, examine, and filter Auto-RP discovery and announcement messages at the administratively scoped boundary by entering the **filter-autorp** keyword. Any Auto-RP group range announcements from the Auto-RP packets that are denied by the boundary ACL are removed. An Auto-RP group range announcement is permitted and passed by the boundary only if all addresses in the Auto-RP group range are permitted by the boundary ACL. If any address is not permitted, the entire group range is filtered and removed from the Auto-RP message before the Auto-RP message is forwarded.

To configure a multicast boundary, enter the following command:

Command	Purpose
multicast boundary <i>acl</i> [filter-autorp]	Configures a multicast boundary.
Example: <pre>hostname(config-if)# multicast boundary acl1 [filter-autorp]</pre>	

Configuration Example for Multicast Routing

The following example shows how to enable and configure multicast routing with various optional processes:

Step 1 Enable multicast routing:

```
hostname(config)# multicast-routing
```

Step 2 Configure a static multicast route:

```
hostname(config)# mroute src_ip src_mask {input_if_name | rpf_neighbor} [distance]
hostname(config)# exit
```

Step 3 Configure the ASA to be a member of a multicast group:

```
hostname(config)# interface
hostname(config-if)# igmp join-group group-address
```

CHAPTER 27

Configuring EIGRP

This chapter describes how to configure the ASA to route data, perform authentication, and redistribute routing information using the Enhanced Interior Gateway Routing Protocol (EIGRP).

The chapter includes the following sections:

- [Information About EIGRP, page 27-1](#)
- [Licensing Requirements for EIGRP, page 27-2](#)
- [Guidelines and Limitations, page 27-2](#)
- [Configuring EIGRP, page 27-3](#)
- [Customizing EIGRP, page 27-4](#)
- [Monitoring EIGRP, page 27-17](#)
- [Configuration Example for EIGRP, page 27-18](#)
- [Feature History for EIGRP, page 27-19](#)

Information About EIGRP

EIGRP is an enhanced version of IGRP developed by Cisco. Unlike IGRP and RIP, EIGRP does not send out periodic route updates. EIGRP updates are sent out only when the network topology changes. Key capabilities that distinguish EIGRP from other routing protocols include fast convergence, support for variable-length subnet mask, support for partial updates, and support for multiple network layer protocols.

A router running EIGRP stores all the neighbor routing tables so that it can quickly adapt to alternate routes. If no appropriate route exists, EIGRP queries its neighbors to discover an alternate route. These queries propagate until an alternate route is found. Its support for variable-length subnet masks permits routes to be automatically summarized on a network number boundary. In addition, EIGRP can be configured to summarize on any bit boundary at any interface. EIGRP does not make periodic updates. Instead, it sends partial updates only when the metric for a route changes. Propagation of partial updates is automatically bounded so that only those routers that need the information are updated. As a result of these two capabilities, EIGRP consumes significantly less bandwidth than IGRP.

Neighbor discovery is the process that the ASA uses to dynamically learn of other routers on directly attached networks. EIGRP routers send out multicast hello packets to announce their presence on the network. When the ASA receives a hello packet from a new neighbor, it sends its topology table to the neighbor with an initialization bit set. When the neighbor receives the topology update with the initialization bit set, the neighbor sends its topology table back to the ASA.

The hello packets are sent out as multicast messages. No response is expected to a hello message. The exception to this is for statically defined neighbors. If you use the **neighbor** command, or configure the Hello Interval in ASDM, to configure a neighbor, the hello messages sent to that neighbor are sent as unicast messages. Routing updates and acknowledgements are sent out as unicast messages.

Once this neighbor relationship is established, routing updates are not exchanged unless there is a change in the network topology. The neighbor relationship is maintained through the hello packets. Each hello packet received from a neighbor includes a hold time. This is the time in which the ASA can expect to receive a hello packet from that neighbor. If the ASA does not receive a hello packet from that neighbor within the hold time advertised by that neighbor, the ASA considers that neighbor to be unavailable.

The EIGRP protocol uses four key algorithm technologies, four key technologies, including neighbor discovery/recovery, Reliable Transport Protocol (RTP), and DUAL, which is important for route computations. DUAL saves all routes to a destination in the topology table, not just the least-cost route. The least-cost route is inserted into the routing table. The other routes remain in the topology table. If the main route fails, another route is chosen from the feasible successors. A successor is a neighboring router used for packet forwarding that has a least-cost path to a destination. The feasibility calculation guarantees that the path is not part of a routing loop.

If a feasible successor is not found in the topology table, a route recomputation must occur. During route recomputation, DUAL queries the EIGRP neighbors for a route, who in turn query their neighbors. Routers that do not have a feasible successor for the route return an unreachable message.

During route recomputation, DUAL marks the route as active. By default, the ASA waits for three minutes to receive a response from its neighbors. If the ASA does not receive a response from a neighbor, the route is marked as stuck-in-active. All routes in the topology table that point to the unresponsive neighbor as a feasibility successor are removed.

**Note**

EIGRP neighbor relationships are not supported through the IPsec tunnel without a GRE tunnel.

Licensing Requirements for EIGRP

The following table shows the licensing requirements for this feature:

Model	License Requirement
All models	Base License.

Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

Context Mode Guidelines

Supported in single context mode.

Firewall Mode Guidelines

Supported only in routed firewall mode. Transparent firewall mode is not supported.

IPv6 Guidelines

Does not support IPv6.

Configuring EIGRP

This section explains how to enable the EIGRP process on your system. After you have enabled EIGRP, see the following sections to learn how to customize the EIGRP process on your system.

- [Enabling EIGRP, page 27-3](#)
- [Enabling EIGRP Stub Routing, page 27-3](#)

Enabling EIGRP

You can only enable one EIGRP routing process on the ASA.

To enable EIGRP, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router eigrp <i>as-num</i>	Creates an EIGRP routing process and enters router configuration mode for this EIGRP process.
	Example: hostname(config)# router eigrp 2	The <i>as-num</i> argument is the autonomous system number of the EIGRP routing process.
Step 2	network <i>ip-addr</i> [<i>mask</i>]	Configures the interfaces and networks that participate in EIGRP routing. You can configure one or more network statements with this command.
	Example: hostname(config)# router eigrp 2 hostname(config-router)# network 10.0.0.0 255.0.0.0	Directly connected and static networks that fall within the defined network are advertised by the ASA. Additionally, only interfaces with an IP address that fall within the defined network participate in the EIGRP routing process. If you have an interface that you do not want to have participate in EIGRP routing, but that is attached to a network that you want advertised, see the “Configuring Interfaces for EIGRP” section on page 27-6 .

Enabling EIGRP Stub Routing

You can enable, and configure the ASA as an EIGRP stub router. Stub routing decreases memory and processing requirements on the ASA. As a stub router, the ASA does not need to maintain a complete EIGRP routing table because it forwards all nonlocal traffic to a distribution router. Generally, the distribution router need not send anything more than a default route to the stub router.

Only specified routes are propagated from the stub router to the distribution router. As a stub router, the ASA responds to all queries for summaries, connected routes, redistributed static routes, external routes, and internal routes with the message “inaccessible.” When the ASA is configured as a stub, it sends a special peer information packet to all neighboring routers to report its status as a stub router. Any

neighbor that receives a packet informing it of the stub status will not query the stub router for any routes, and a router that has a stub peer will not query that peer. The stub router depends on the distribution router to send the correct updates to all peers.

To enable the ASA as an EIGRP stub routing process, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router eigrp <i>as-num</i>	Creates an EIGRP routing process and enters router configuration mode for this EIGRP process.
	Example: hostname(config)# router eigrp 2	The <i>as-num</i> argument is the autonomous system number of the EIGRP routing process.
Step 2	network <i>ip-addr</i> [<i>mask</i>]	Configures the interfaces and networks that participate in EIGRP routing. You can configure one or more network statements with this command.
	Example: hostname(config)# router eigrp 2 hostname(config-router)# network 10.0.0.0 255.0.0.0	Directly connected and static networks that fall within the defined network are advertised by the ASA. Additionally, only interfaces with an IP address that fall within the defined network participate in the EIGRP routing process.
		If you have an interface that you do not want to have participate in EIGRP routing, but that is attached to a network that you want advertised, see the section “Configuring Passive Interfaces” section on page 27-7.
Step 3	eigrp stub { receive-only [connected] [redistributed] [static] [summary]}	Configures the stub routing process. You must specify which networks are advertised by the stub routing process to the distribution router. Static and connected networks are not automatically redistributed into the stub routing process.
	Example: hostname(config)# router eigrp 2 hostname(config-router)# network 10.0.0.0 255.0.0.0 hostname(config-router)# eigrp stub {receive-only [connected] [redistributed] [static] [summary]}	

Note

A stub routing process does not maintain a full topology table. At a minimum, stub routing needs a default route to a distribution router, which makes the routing decisions.

Customizing EIGRP

This section describes how to customize the EIGRP routing and includes the following topics:

- [Defining a Network for an EIGRP Routing Process, page 27-5](#)
- [Configuring Interfaces for EIGRP, page 27-6](#)
- [Configuring the Summary Aggregate Addresses on Interfaces, page 27-8](#)

- [Redistributing Routes Into EIGRP, page 27-11](#)
- [Filtering Networks in EIGRP, page 27-12](#)
- [Customizing the EIGRP Hello Interval and Hold Time, page 27-13](#)
- [Disabling Automatic Route Summarization, page 27-14](#)
- [Configuring Default Information in EIGRP, page 27-15](#)
- [Disabling EIGRP Split Horizon, page 27-16](#)
- [Restarting the EIGRP Process, page 27-17](#)

Defining a Network for an EIGRP Routing Process

The Network table lets you specify the networks used by the EIGRP routing process. For an interface to participate in EIGRP routing, it must fall within the range of addresses defined by the network entries. For directly connected and static networks to be advertised, they must also fall within the range of the network entries.

The Network table displays the networks configured for the EIGRP routing process. Each row of the table displays the network address and associated mask configured for the specified EIGRP routing process.

To add or define a network, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router eigrp <i>as-num</i> Example: hostname(config)# router eigrp 2	Creates an EIGRP routing process and enters router configuration mode for this EIGRP process. The <i>as-num</i> argument is the autonomous system number of the EIGRP routing process.
Step 2	network <i>ip-addr</i> [<i>mask</i>] Example: hostname(config)# router eigrp 2 hostname(config-router)# network 10.0.0.0 255.0.0.0	Configures the interfaces and networks that participate in EIGRP routing. You can configure one or more network statements with this command. Directly connected and static networks that fall within the defined network are advertised by the ASA. Additionally, only interfaces with an IP address that fall within the defined network participate in the EIGRP routing process. If you have an interface that you do not want to have participate in EIGRP routing, but that is attached to a network that you want advertised, see the “Configuring Passive Interfaces” section on page 27-7 .

Configuring Interfaces for EIGRP

If you have an interface that you do not want to have participate in EIGRP routing, but that is attached to a network that you want advertised, you can configure a **network** command that includes the network to which the interface is attached, and use the **passive-interface** command to prevent that interface from sending or receiving EIGRP updates.

To configure interfaces for EIGRP, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router eigrp <i>as-num</i>	Creates an EIGRP routing process and enters router configuration mode for this EIGRP process.
	Example: hostname(config)# router eigrp 2	The <i>as-num</i> argument is the autonomous system number of the EIGRP routing process.
Step 2	hostname(config-router)# network <i>ip-addr</i> [<i>mask</i>]	Configures the interfaces and networks that participate in EIGRP routing. You can configure one or more network statements with this command.
	Example: hostname(config)# router eigrp 2 hostname(config-router)# network 10.0.0.0 255.0.0.0	Directly connected and static networks that fall within the defined network are advertised by the ASA. Additionally, only interfaces with an IP address that fall within the defined network participate in the EIGRP routing process.
		If you have an interface that you do not want to have participate in EIGRP routing, but that is attached to a network that you want advertised, see the “Defining a Network for an EIGRP Routing Process” section on page 27-5.
Step 3	(Optional) Do one of the following to customize an interface to participate in EIGRP routing:	
	no default-information { <i>in</i> <i>out</i> <i>WORD</i> }	Allows you to control the sending or receiving of candidate default route information.
	Example: hostname(config)# router eigrp 2 hostname(config-router)# network 10.0.0.0 255.0.0.0 hostname(config-router)# no default-information { <i>in</i> <i>out</i> <i>WORD</i> }	Entering the no default-information in command causes the candidate default route bit to be blocked on received routes. Entering the no default-information out command disables the setting of the default route bit in advertised routes.
		See the “Configuring Default Information in EIGRP” section on page 27-15 for more information on this particular option.
	authentication mode eigrp <i>as-num</i> <i>md5</i>	Enables MD5 authentication of EIGRP packets.
	Example: hostname(config)# authentication mode eigrp 2 md5	The <i>as-num</i> argument is the autonomous system number of the EIGRP routing process configured on the ASA. If EIGRP is not enabled or if you enter the wrong number, the ASA returns the following error message: % Asystem(100) specified does not exist
		See the “Enabling EIGRP Authentication on an Interface” section on page 27-9 for more information on this particular option.

Command	Purpose
delay <i>value</i> Example: hostname(config-if)# delay 200	The <i>value</i> argument entered is in tens of microseconds. To set the delay for 2000 microseconds, you enter a <i>value</i> of 200. To view the delay value assigned to an interface, use the show interface command. See the “Changing the Interface Delay Value” section on page 27-9 for more information on this particular option.
hello-interval eigrp <i>as-num seconds</i> Example: hostname(config)# hello-interval eigrp 2 60	Allows you to change the hello interval. See the “Customizing the EIGRP Hello Interval and Hold Time” section on page 27-13 for more information on this particular option.
hold-time eigrp <i>as-num seconds</i> Example: hostname(config)# hold-time eigrp 2 60	Allows you to change the hold time. See the “Customizing the EIGRP Hello Interval and Hold Time” section on page 27-13 for more information on this particular option.

Configuring Passive Interfaces

You can configure one or more interfaces as passive interfaces. In EIGRP, a passive interface does not send or receive routing updates.

To configure passive interfaces, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router eigrp <i>as-num</i> Example: hostname(config)# router eigrp 2	Creates an EIGRP routing process and enters router configuration mode for this EIGRP process. The <i>as-num</i> argument is the autonomous system number of the EIGRP routing process.

	Command	Purpose
Step 2	<pre>hostname(config-router)# network ip-addr [mask]</pre> Example: <pre>hostname(config)# router eigrp 2 hostname(config-router)# network 10.0.0.0 255.0.0.0</pre>	Configures the interfaces and networks that participate in EIGRP routing. You can configure one or more network statements with this command. Directly connected and static networks that fall within the defined network are advertised by the ASA. Additionally, only interfaces with an IP address that fall within the defined network participate in the EIGRP routing process. If you have an interface that you do not want to have participate in EIGRP routing, but that is attached to a network that you want advertised, see the “Defining a Network for an EIGRP Routing Process” section on page 27-5.
Step 3	<pre>passive-interface {default if-name}</pre> Example: <pre>hostname(config)# router eigrp 2 hostname(config-router)# network 10.0.0.0 255.0.0.0 hostname(config-router)# passive-interface {default}</pre>	Prevents an interface from sending or receiving EIGRP routing message. Using the default keyword disables EIGRP routing updates on all interfaces. Specifying an interface name, as defined by the nameif command, disables EIGRP routing updates on the specified interface. You can use multiple passive-interface commands in your EIGRP router configuration.

Configuring the Summary Aggregate Addresses on Interfaces

You can configure a summary addresses on a per-interface basis. You need to manually define summary addresses if you want to create summary addresses that do not occur at a network number boundary or if you want to use summary addresses on a ASA with automatic route summarization disabled. If any more specific routes are in the routing table, EIGRP will advertise the summary address out the interface with a metric equal to the minimum of all more specific routes.

To create a summary address, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	<pre>interface phy_if</pre> Example: <pre>hostname(config)# interface phy_if</pre>	Enters interface configuration mode for the interface on which you are changing the delay value used by EIGRP.
Step 2	<pre>summary-address eigrp as-num address mask [distance]</pre> Example: <pre>hostname(config-if)# summary-address eigrp 2 address mask [20]</pre>	Creates the summary address. By default, EIGRP summary addresses that you define have an administrative distance of 5. You can change this value by specifying the optional <i>distance</i> argument in the summary-address command.

Changing the Interface Delay Value

The interface delay value is used in EIGRP distance calculations. You can modify this value on a per-interface basis.

To change the interface delay value, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	interface <i>phy_if</i> Example: hostname(config)# interface <i>phy_if</i>	Enters interface configuration mode for the interface on which you are changing the delay value used by EIGRP.
Step 2	delay <i>value</i> Example: hostname(config-if)# delay 200	The <i>value</i> argument entered is in tens of microseconds. To set the delay for 2000 microseconds, you enter a <i>value</i> of 200. To view the delay value assigned to an interface, use the show interface command.

Enabling EIGRP Authentication on an Interface

EIGRP route authentication provides MD5 authentication of routing updates from the EIGRP routing protocol. The MD5 keyed digest in each EIGRP packet prevents the introduction of unauthorized or false routing messages from unapproved sources.

EIGRP route authentication is configured on a per-interface basis. All EIGRP neighbors on interfaces configured for EIGRP message authentication must be configured with the same authentication mode and key for adjacencies to be established.

Note

Before you can enable EIGRP route authentication, you must enable EIGRP.

To enable EIGRP authentication on an interface, perform the following steps:

Detailed Steps

Step 1	router eigrp <i>as-num</i> Example: hostname(config)# router eigrp 2	Creates an EIGRP routing process and enters router configuration mode for this EIGRP process. The <i>as-num</i> argument is the autonomous system number of the EIGRP routing process.
Step 2	network <i>ip-addr</i> [<i>mask</i>] Example: hostname(config)# router eigrp 2 hostname(config-router)# network 10.0.0.0 255.0.0.0	Configures the interfaces and networks that participate in EIGRP routing. You can configure one or more network statements with this command. Directly connected and static networks that fall within the defined network are advertised by the ASA. Additionally, only interfaces with an IP address that falls within the defined network participate in the EIGRP routing process. If you have an interface that you do not want to have participate in EIGRP routing, but that is attached to a network that you want advertised, see the “Configuring EIGRP” section on page 27-3 .
Step 3	interface <i>phy_if</i> Example: hostname(config)# interface <i>phy_if</i>	Enters interface configuration mode for the interface on which you are configuring EIGRP message authentication.
Step 4	authentication mode eigrp <i>as-num</i> md5 Example: hostname(config)# authentication mode eigrp 2 md5	Enables MD5 authentication of EIGRP packets. The <i>as-num</i> argument is the autonomous system number of the EIGRP routing process configured on the ASA. If EIGRP is not enabled or if you enter the wrong number, the ASA returns the following error message: % Asystem(100) specified does not exist
Step 5	authentication key eigrp <i>as-num</i> key key-id <i>key-id</i> Example: hostname(config)# authentication key eigrp 2 cisco key-id 200	Configures the key used by the MD5 algorithm. The <i>as-num</i> argument is the autonomous system number of the EIGRP routing process configured on the ASA. If EIGRP is not enabled or if you enter the wrong number, the ASA returns the following error message: % Asystem(100) specified does not exist The <i>key</i> argument can include up to 16 characters. The <i>key-id</i> argument is a number that can range from 0 to 255.

Defining an EIGRP Neighbor

EIGRP hello packets are sent as multicast packets. If an EIGRP neighbor is located across a non broadcast network, such as a tunnel, you must manually define that neighbor. When you manually define an EIGRP neighbor, hello packets are sent to that neighbor as unicast messages.

To manually define an EIGRP neighbor, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router eigrp <i>as-num</i>	Creates an EIGRP routing process and enters router configuration mode for this EIGRP process.
	Example: hostname(config)# router eigrp 2	The <i>as-num</i> argument is the autonomous system number of the EIGRP routing process.
Step 2	neighbor <i>ip-addr</i> interface <i>if_name</i>	Defines the static neighbor.
	Example: hostname(config)# router eigrp 2 hostname(config-router)# neighbor 10.0.0.0 interface interface1	The <i>ip-addr</i> argument is the IP address of the neighbor. The <i>if_name</i> argument is the name of the interface, as specified by the nameif command, through which that neighbor is available. You can define multiple neighbors for an EIGRP routing process.

Redistributing Routes Into EIGRP

You can redistribute routes discovered by RIP and OSPF into the EIGRP routing process. You can also redistribute static and connected routes into the EIGRP routing process. You do not need to redistribute connected routes if they fall within the range of a **network** statement in the EIGRP configuration.

Note

For RIP only: Before you begin this procedure, you must create a route-map to further define which routes from the specified routing protocol are redistributed in to the RIP routing process. See [Chapter 23, “Defining Route Maps,”](#) for more information about creating a route map.

To redistribute routes into the EIGRP routing process, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router eigrp <i>as-num</i>	Creates an EIGRP routing process and enters router configuration mode for this EIGRP process.
	Example: hostname(config)# router eigrp 2	The <i>as-num</i> argument is the autonomous system number of the EIGRP routing process.
Step 2	default-metric <i>bandwidth delay reliability loading mtu</i>	(Optional) Specifies the default metrics that should be applied to routes redistributed into the EIGRP routing process.
	Example: hostname(config)# router eigrp 2 hostname(config-router)# default-metric bandwidth delay reliability loading mtu	If you do not specify a default metric in the EIGRP router configuration, you must specify the metric values in each redistribute command. If you specify the EIGRP metrics in the redistribute command and have the default-metric command in the EIGRP router configuration, the metrics in the redistribute command are used.
Step 3	Do one of the following to redistribute the selected route type into the EIGRP routing process. You must specify the EIGRP metric values in the redistribute command if you do not have a default-metric command in the EIGRP router configuration.	

Command	Purpose
redistribute connected [metric <i>bandwidth delay reliability loading mtu</i>] [route-map <i>map_name</i>] Example: hostname(config-router): redistribute connected [metric <i>bandwidth delay reliability loading mtu</i>] [route-map <i>map_name</i>]	Redistributes connected routes into the EIGRP routing process.
redistribute static [metric <i>bandwidth delay reliability loading mtu</i>] [route-map <i>map_name</i>] Example: hostname(config-router): redistribute static [metric <i>bandwidth delay reliability loading mtu</i>] [route-map <i>map_name</i>]	Redistributes static routes into the EIGRP routing process.
redistribute ospf <i>pid</i> [match { internal external [1 2] nssa-external [1 2]}] [metric <i>bandwidth delay reliability loading mtu</i>] [route-map <i>map_name</i>] Example: hostname(config-router): redistribute ospf <i>pid</i> [match {internal external [1 2] nssa-external [1 2]}] [metric <i>bandwidth delay reliability loading mtu</i>] [route-map <i>map_name</i>]	Redistributes routes from an OSPF routing process into the EIGRP routing process.
redistribute rip [metric <i>bandwidth delay reliability load mtu</i>] [route-map <i>map_name</i>] Example: (config-router): redistribute rip [metric <i>bandwidth delay reliability load mtu</i>] [route-map <i>map_name</i>]	Redistributes routes from a RIP routing process into the EIGRP routing process.

Filtering Networks in EIGRP

Note

Before you begin this process, you must create a standard access list that defines the routes that you want to advertise. That is, create a standard access list that defines the routes that you want to filter from sending or receiving updates.

To filter networks in EIGRP, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router eigrp <i>as-num</i>	Creates an EIGRP routing process and enters router configuration mode for this EIGRP process.
	Example: hostname(config)# router eigrp 2	The <i>as-num</i> argument is the autonomous system number of the EIGRP routing process.
Step 2	hostname(config-router)# network <i>ip-addr</i> [<i>mask</i>]	Configures the interfaces and networks that participate in EIGRP routing. You can configure one or more network statements with this command.
	Example: hostname(config)# router eigrp 2 hostname(config-router)# network 10.0.0.0 255.0.0.0	Directly connected and static networks that fall within the defined network are advertised by the ASA. Additionally, only interfaces with an IP address that fall within the defined network participate in the EIGRP routing process. If you have an interface that you do not want to have participate in EIGRP routing, but that is attached to a network that you want advertised, see the “Configuring Interfaces for EIGRP” section on page 27-6 .
Step 3	Do one of the following to filter networks sent or received in EIGRP routing updates. You can enter multiple distribute-list commands in your EIGRP router configuration.	
	distribute-list <i>acl</i> out [connected ospf rip static interface <i>if_name</i>]	Filters networks sent in EIGRP routing updates. You can specify an interface to apply the filter to only those updates that are sent by that specific interface.
	Example: hostname(config)# router eigrp 2 hostname(config-router)# network 10.0.0.0 255.0.0.0 hostname(config-router): distribute-list acl out [connected]	
	distribute-list <i>acl</i> in [interface <i>if_name</i>]	Filters networks received in EIGRP routing updates. You can specify an interface to apply the filter to only those updates that are received by that interface.
	Example: hostname(config)# router eigrp 2 hostname(config-router)# network 10.0.0.0 255.0.0.0 hostname(config-router): distribute-list acl in [interface interface1]	

Customizing the EIGRP Hello Interval and Hold Time

The ASA periodically sends hello packets to discover neighbors and to learn when neighbors become unreachable or inoperative. By default, hello packets are sent every 5 seconds.

The hello packet advertises the ASA hold time. The hold time indicates to EIGRP neighbors the length of time the neighbor should consider the ASA reachable. If the neighbor does not receive a hello packet within the advertised hold time, then the ASA is considered unreachable. By default, the advertised hold time is 15 seconds (three times the hello interval).

Both the hello interval and the advertised hold time are configured on a per-interface basis. We recommend setting the hold time to be at minimum three times the hello interval.

To configure the hello interval and advertised hold time, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	interface <i>phy_if</i> Example: hostname(config)# interface <i>phy_if</i>	Enters interface configuration mode for the interface on which you are configuring the hello interval or advertised hold time.
Step 2	hello-interval eigrp <i>as-num seconds</i> Example: hostname(config)# hello-interval eigrp 2 60	Changes the hello interval.
Step 3	hold-time eigrp <i>as-num seconds</i> Example: hostname(config)# hold-time eigrp 2 60	Changes the hold time.

Disabling Automatic Route Summarization

Automatic route summarization is enabled by default. The EIGRP routing process summarizes on network number boundaries. This can cause routing problems if you have noncontiguous networks.

For example, if you have a router with the networks 192.168.1.0, 192.168.2.0, and 192.168.3.0 connected to it, and those networks all participate in EIGRP, the EIGRP routing process creates the summary address 192.168.0.0 for those routes. If an additional router is added to the network with the networks 192.168.10.0 and 192.168.11.0, and those networks participate in EIGRP, they will also be summarized as 192.168.0.0. To prevent the possibility of traffic being routed to the wrong location, you should disable automatic route summarization on the routers creating the conflicting summary addresses.

To disable automatic route summarization, enter the following commands:

Detailed Steps

	Command	Purpose
Step 1	router eigrp <i>as-num</i>	Creates an EIGRP routing process and enters router configuration mode for this EIGRP process.
	Example: hostname(config)# router eigrp 2	The <i>as-num</i> argument is the autonomous system number of the EIGRP routing process.
Step 2	no auto-summary	You cannot configure this value. Automatic summary addresses have an administrative distance of 5.
	Example: hostname(config-router)# no auto-summary	

Configuring Default Information in EIGRP

You can control the sending and receiving of default route information in EIGRP updates. By default, default routes are sent and accepted. Configuring the ASA to disallow default information to be received causes the candidate default route bit to be blocked on received routes. Configuring the ASA to disallow default information to be sent disables the setting of the default route bit in advertised routes.

To configure default routing information, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	router eigrp <i>as-num</i>	Creates an EIGRP routing process and enters router configuration mode for this EIGRP process.
	Example: hostname(config)# router eigrp 2	The <i>as-num</i> argument is the autonomous system number of the EIGRP routing process.

	Command	Purpose
Step 2	<pre>hostname(config-router)# network ip-addr [mask]</pre> Example: <pre>hostname(config)# router eigrp 2 hostname(config-router)# network 10.0.0.0 255.0.0.0</pre>	Configures the interfaces and networks that participate in EIGRP routing. You can configure one or more network statements with this command. Directly connected and static networks that fall within the defined network are advertised by the ASA. Additionally, only interfaces with an IP address that fall within the defined network participate in the EIGRP routing process. If you have an interface that you do not want to have participate in EIGRP routing, but that is attached to a network that you want advertised, see the “Configuring Interfaces for EIGRP” section on page 27-6.
Step 3	<pre>no default-information {in out WORD}</pre> Example: <pre>hostname(config)# router eigrp 2 hostname(config-router)# network 10.0.0.0 255.0.0.0 hostname(config-router)# no default-information {in out WORD}</pre>	Controls the sending or receiving of candidate default route information. Entering the no default-information in command causes the candidate default route bit to be blocked on received routes. Entering the no default-information out command disables the setting of the default route bit in advertised routes.

Disabling EIGRP Split Horizon

Split horizon controls the sending of EIGRP update and query packets. When split horizon is enabled on an interface, update and query packets are not sent for destinations for which this interface is the next hop. Controlling update and query packets in this manner reduces the possibility of routing loops.

By default, split horizon is enabled on all interfaces.

Split horizon blocks route information from being advertised by a router out of any interface from which that information originated. This behavior usually optimizes communications among multiple routing devices, particularly when links are broken. However, with nonbroadcast networks, there may be situations where this behavior is not desired. For these situations, including networks in which you have EIGRP configured, you may want to disable split horizon.

If you disable split horizon on an interface, you must disable it for all routers and access servers on that interface.

To disable EIGRP split horizon, perform the following steps:

Detailed Steps

	Command	Purpose
Step 1	interface <i>phy_if</i> Example: hostname(config)# interface <i>phy_if</i>	Enters interface configuration mode for the interface on which you are changing the delay value used by EIGRP.
Step 2	no split-horizon eigrp <i>as-number</i> Example: hostname(config-if)# no split-horizon eigrp 2	Disables the split horizon.

Restarting the EIGRP Process

To restart an EIGRP process or clear redistribution or counters, enter the following command:

Command	Purpose
clear eigrp pid {1-65535 neighbors topology events } Example: hostname(config)# clear eigrp pid 10 neighbors	Restarts an EIGRP process or clears redistribution or counters.

Monitoring EIGRP

You can use the following commands to monitor the EIGRP routing process. For examples and descriptions of the command output, see the *Cisco ASA 5500 Series Command Reference*. Additionally, you can disable the logging of neighbor change messages and neighbor warning messages.

To monitor or disable various EIGRP routing statistics, enter one of the following commands:

Command	Purpose
Monitoring EIGRP Routing	
show eigrp [<i>as-number</i>] events [{ <i>start end</i> } type]	Displays the EIGRP event log.
show eigrp [<i>as-number</i>] neighbors [detail static] [<i>if-name</i>]	Displays the EIGRP neighbor table.
show eigrp [<i>as-number</i>] interfaces [<i>if-name</i>] [detail]	Displays the interfaces participating in EIGRP routing.
show eigrp [<i>as-number</i>] topology [<i>ip-addr</i> [<i>mask</i>] active all-links pending summary zero-successors]	Displays the EIGRP topology table.
show eigrp [<i>as-number</i>] traffic	Displays EIGRP traffic statistics.
router-id	Displays the router-id for this EIGRP process.

Command (continued)	Purpose (continued)
Disabling EIGRP Logging Messages	
<code>no eigrp log-neighbor-changes</code>	Disables the logging of neighbor change messages. Enter this command in router configuration mode for the EIGRP routing process.
<code>no eigrp log-neighbor-warnings</code>	Disables the logging of neighbor warning messages.

**Note**

By default, neighbor change and neighbor warning messages are logged.

Configuration Example for EIGRP

The following example shows how to enable and configure EIGRP with various optional processes:

-
- Step 1** To enable EIGRP, enter the following commands:
- ```
hostname(config)# router eigrp 2
hostname(config-router)# network 10.0.0.0 255.0.0.0
```
- Step 2** To configure an interface from sending or receiving EIGRP routing messages, enter the following command:
- ```
hostname(config-router)# passive-interface {default}
```
- Step 3** To define an EIGRP neighbor, enter the following command:
- ```
hostname(config-router)# neighbor 10.0.0.0 interface interface1
```
- Step 4** To configure the interfaces and networks that participate in EIGRP routing, enter the following command:
- ```
hostname(config-router)# network 10.0.0.0 255.0.0.0
```
- Step 5** To change the interface delay value used in EIGRP distance calculations, enter the following commands:
- ```
hostname(config-router)# exit
hostname(config)# interface phy_if
hostname(config-if)# delay 200
```
-

# Feature History for EIGRP

Table 27-1 lists each feature change and the platform release in which it was implemented.

**Table 27-1**      *Feature History for EIGRP*

| Feature Name  | Platform Releases | Feature Information                                                                                                                                                                                                                                 |

# CHAPTER 28

## Configuring IPv6 Neighbor Discovery

---

This chapter describes how to enable and configure IPv6 neighbor discovery on the ASA and includes the following sections:

- [Information About IPv6 Neighbor Discovery, page 28-1](#)
- [Licensing Requirements for IPv6 Neighbor Discovery, page 28-4](#)
- [Guidelines and Limitations, page 28-4](#)
- [Default Settings for IPv6 Neighbor Discovery, page 28-6](#)
- [Configuring the Neighbor Solicitation Message Interval, page 28-6](#)
- [Configuring the Neighbor Reachable Time, page 28-7](#)
- [Configuring the Router Advertisement Transmission Interval, page 28-7](#)
- [Configuring the Router Lifetime Value, page 28-8](#)
- [Configuring Duplicate Address Detection Settings, page 28-8](#)
- [Configuring IPv6 Addresses on an Interface, page 28-9](#)
- [Suppressing Router Advertisement Messages, page 28-9](#)
- [Configuring the IPv6 Prefix, page 28-10](#)
- [Configuring a Static IPv6 Neighbor, page 28-11](#)
- [Monitoring IPv6 Neighbor Discovery, page 28-12](#)
- [Additional References, page 28-12](#)
- [Feature History for IPv6 Neighbor Discovery, page 28-13](#)

## Information About IPv6 Neighbor Discovery

The IPv6 neighbor discovery process uses ICMPv6 messages and solicited-node multicast addresses to determine the link-layer address of a neighbor on the same network (local link), verify the readability of a neighbor, and keep track of neighboring routers.

Nodes (hosts) use neighbor discovery to determine the link-layer addresses for neighbors known to reside on attached links and to quickly purge cached values that become invalid. Hosts also use neighbor discovery to find neighboring routers that are willing to forward packets on their behalf. In addition, nodes use the protocol to actively keep track of which neighbors are reachable and which are not, and to detect changed link-layer addresses. When a router or the path to a router fails, a host actively searches for functioning alternates.

This section includes the following topics:

- [Neighbor Solicitation Messages, page 28-2](#)
- [Neighbor Reachable Time, page 28-3](#)
- [Router Advertisement Messages, page 28-3](#)
- [Static IPv6 Neighbors, page 28-4](#)

## Neighbor Solicitation Messages

Neighbor solicitation messages (ICMPv6 Type 135) are sent on the local link by nodes attempting to discover the link-layer addresses of other nodes on the local link. The neighbor solicitation message is sent to the solicited-node multicast address. The source address in the neighbor solicitation message is the IPv6 address of the node sending the neighbor solicitation message. The neighbor solicitation message also includes the link-layer address of the source node.

After receiving a neighbor solicitation message, the destination node replies by sending a neighbor advertisement message (ICMPv6 Type 136) on the local link. The source address in the neighbor advertisement message is the IPv6 address of the node sending the neighbor advertisement message; the destination address is the IPv6 address of the node that sent the neighbor solicitation message. The data portion of the neighbor advertisement message includes the link-layer address of the node sending the neighbor advertisement message.

After the source node receives the neighbor advertisement, the source node and destination node can communicate. [Figure 28-1](#) shows the neighbor solicitation and response process.

**Figure 28-1** IPv6 Neighbor Discovery—Neighbor Solicitation Message

Neighbor solicitation messages are also used to verify the reachability of a neighbor after the link-layer address of a neighbor is identified. When a node wants to verify the reachability of a neighbor, the destination address in a neighbor solicitation message is the unicast address of the neighbor.

Neighbor advertisement messages are also sent when there is a change in the link-layer address of a node on a local link. When there is such a change, the destination address for the neighbor advertisement is the all-nodes multicast address.

## Neighbor Reachable Time

The neighbor reachable time enables detecting unavailable neighbors. Shorter configured times enable detecting unavailable neighbors more quickly, however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.

## Router Advertisement Messages

An ASA can participate in router advertisements so that neighboring devices can dynamically learn a default router address. Router advertisement messages (ICMPv6 Type 134) are periodically sent out each IPv6 configured interface of the ASA. The router advertisement messages are sent to the all-nodes multicast address.

**Figure 28-2** IPv6 Neighbor Discovery—Router Advertisement Message

Router advertisement messages typically include the following information:

- One or more IPv6 prefix that nodes on the local link can use to automatically configure their IPv6 addresses.
- Lifetime information for each prefix included in the advertisement.
- Sets of flags that indicate the type of autoconfiguration (stateless or stateful) that can be completed.
- Default router information (whether the router sending the advertisement should be used as a default router and, if so, the amount of time (in seconds) the router should be used as a default router).
- Additional information for hosts, such as the hop limit and MTU a host should use in packets that it originates.
- The amount of time between neighbor solicitation message retransmissions on a given link.
- The amount of time a node considers a neighbor reachable.

Router advertisements are also sent in response to router solicitation messages (ICMPv6 Type 133). Router solicitation messages are sent by hosts at system startup so that the host can immediately autoconfigure without needing to wait for the next scheduled router advertisement message. Because router solicitation messages are usually sent by hosts at system startup, and the host does not have a configured unicast address, the source address in router solicitation messages is usually the unspecified IPv6 address (0:0:0:0:0:0:0:0). If the host has a configured unicast address, the unicast address of the interface sending the router solicitation message is used as the source address in the message. The

destination address in router solicitation messages is the all-routers multicast address with a scope of the link. When a router advertisement is sent in response to a router solicitation, the destination address in the router advertisement message is the unicast address of the source of the router solicitation message.

You can configure the following settings for router advertisement messages:

- The time interval between periodic router advertisement messages.
- The router lifetime value, which indicates the amount of time IPv6 nodes should consider the ASA to be the default router.
- The IPv6 network prefixes in use on the link.
- Whether or not an interface transmits router advertisement messages.

Unless otherwise noted, the router advertisement message settings are specific to an interface and are entered in interface configuration mode.

## Static IPv6 Neighbors

You can manually define a neighbor in the IPv6 neighbor cache. If an entry for the specified IPv6 address already exists in the neighbor discovery cache—learned through the IPv6 neighbor discovery process—the entry is automatically converted to a static entry. Static entries in the IPv6 neighbor discovery cache are not modified by the neighbor discovery process.

## Licensing Requirements for IPv6 Neighbor Discovery

The following table shows the licensing requirements for this feature:

| Model      | License Requirement |
|------------|---------------------|
| All models | Base License.       |

## Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

### Context Mode Guidelines

Supported in single and multiple context mode.

### Firewall Mode Guidelines

Supported in routed mode only. Transparent mode is not supported.

### Additional Guidelines and Limitations

- The interval value is included in all IPv6 router advertisements that are sent out of this interface.

- The configured time enables detecting unavailable neighbors. Shorter configured times enable detecting unavailable neighbors more quickly; however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.
- The interval between transmissions should be less than or equal to the IPv6 router advertisement lifetime if the ASA is configured as a default router by using the **ipv6 nd ra-lifetime** command. To prevent synchronization with other IPv6 nodes, randomly adjust the actual value used to within 20 percent of the specified value.
- The **ipv6 nd prefix** command allows control over the individual parameters per prefix, including whether or not the prefix should be advertised.
- By default, prefixes configured as addresses on an interface using the **ipv6 address** command are advertised in router advertisements. If you configure prefixes for advertisement using the **ipv6 nd prefix** command, then only these prefixes are advertised.
- The **default** keyword can be used to set default parameters for all prefixes.
- A date can be set to specify the expiration of a prefix. The valid and preferred lifetimes are counted down in real time. When the expiration date is reached, the prefix will no longer be advertised.
- When onlink is on (by default), the specified prefix is assigned to the link. Nodes sending traffic to such addresses that contain the specified prefix consider the destination to be locally reachable on the link.
- When autoconfig is on (by default), it indicates to hosts on the local link that the specified prefix can be used for IPv6 autoconfiguration.
- For stateless autoconfiguration to work correctly, the advertised prefix length in router advertisement messages must always be 64 bits.
- The router lifetime value is included in all IPv6 router advertisements sent out of the interface. The value indicates the usefulness of the ASA as a default router on this interface.
- Setting the value to a non-zero value indicates that the ASA should be considered a default router on this interface. The non-zero value for the router lifetime value should not be less than the router advertisement interval.

The following guidelines and limitations apply for configuring a static IPv6 neighbor:

- The **ipv6 neighbor** command is similar to the **arp** command. If an entry for the specified IPv6 address already exists in the neighbor discovery cache—learned through the IPv6 neighbor discovery process—the entry is automatically converted to a static entry. These entries are stored in the configuration when the copy command is used to store the configuration.
- Use the **show ipv6 neighbor** command to view static entries in the IPv6 neighbor discovery cache.
- The **clear ipv6 neighbor** command deletes all entries in the IPv6 neighbor discovery cache except static entries. The **no ipv6 neighbor** command deletes a specified static entry from the neighbor discovery cache; the command does not remove dynamic entries—entries learned from the IPv6 neighbor discovery process—from the cache. Disabling IPv6 on an interface by using the **no ipv6 enable** command deletes all IPv6 neighbor discovery cache entries configured for that interface except static entries (the state of the entry changes to INCOMPLETE).
- Static entries in the IPv6 neighbor discovery cache are not modified by the neighbor discovery process.
- The **clear ipv6 neighbor** command does not remove static entries from the IPv6 neighbor discovery cache; it only clears the dynamic entries.

# Default Settings for IPv6 Neighbor Discovery

Table 28-1 lists the default settings for IPv6 Neighbor Discovery.

**Table 28-1**      *Default IPv6 Neighbor Discovery Parameters*

| Parameters                                                                                                        | Default                                                                                                 |
|-------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| <i>value</i> for the neighbor solicitation transmission message interval                                          | 1000 seconds between neighbor solicitation transmissions.                                               |
| <i>value</i> for the neighbor reachable time                                                                      | The default is 0.                                                                                       |
| <i>value</i> for the router advertisement transmission interval                                                   | The default is 200 seconds.                                                                             |
| <i>value</i> for the router lifetime                                                                              | The default is 1800 seconds.                                                                            |
| <i>value</i> for the number of consecutive neighbor solicitation messages sent during duplicate address detection | The default is one message.                                                                             |
| prefix lifetime                                                                                                   | The default lifetime is 2592000 seconds (30 days), and a preferred lifetime is 604800 seconds (7 days). |
| on-link flag                                                                                                      | The flag is on by default, which means that the prefix is used on the advertising interface.            |
| autoconfig flag                                                                                                   | The flag is on by default, which means that the prefix is used for autoconfiguration.                   |
| static IPv6 neighbor                                                                                              | Static entries are not configured in the IPv6 neighbor discovery cache.                                 |

## Configuring the Neighbor Solicitation Message Interval

To configure the interval between IPv6 neighbor solicitation retransmissions on an interface, enter the following command:

| Command                                                                  | Purpose                                                                                                                                             |
|--------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ipv6 nd ns-interval</b> <i>value</i>                                  | Sets the interval between IPv6 neighbor solicitation retransmissions on an interface.                                                               |
| <b>Example:</b><br>hostname (config-if)# <b>ipv6 nd ns-interval</b> 9000 | Valid values for the value argument range from 1000 to 3600000 milliseconds.<br><br>This information is also sent in router advertisement messages. |

### Examples

The following example configures an IPv6 neighbor solicitation transmission interval of 9000 milliseconds for GigabitEthernet 0/0:

```
hostname (config)# interface gigabitethernet 0/0
hostname (config-if)# ipv6 nd ns-interval 9000
```

## Configuring the Neighbor Reachable Time

To configure the amount of time that a remote IPv6 node is considered reachable after a reachability confirmation event has occurred, enter the following command:

| Command                                                                              | Purpose                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ipv6 nd reachable-time value</code>                                            | Sets the amount of time that a remote IPv6 node is reachable.<br>Valid values for the <i>value</i> argument range from 0 to 3600000 milliseconds.<br>When 0 is used for the value, the reachable time is sent as undetermined. It is up to the receiving devices to set and track the reachable time value. |
| <b>Example:</b><br><code>hostname (config-if)# ipv6 nd reachable-time 1700000</code> |                                                                                                                                                                                                                                                                                                             |

### Examples

The following example configures an IPv6 reachable time of 1700000 milliseconds for the selected interface, GigabitEthernet 0/0:

```
hostname (config)# interface gigabitethernet 0/0
hostname (config-if)# ipv6 nd reachable-time 1700000
```

## Configuring the Router Advertisement Transmission Interval

To configure the interval between IPv6 router advertisement transmissions on an interface, enter the following command:

| Command                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ipv6 nd ra-interval [msec] value</code>                                 | Sets the interval between IPv6 router advertisement transmissions.<br>The optional <b>msec</b> keyword indicates that the value provided is in milliseconds. If this keyword is not present, the value provided is in seconds.<br>Valid values for the <i>value</i> argument range from 3 to 1800 seconds or from 500 to 1800000 milliseconds if the <b>msec</b> keyword is provided.<br>The interval between transmissions should be less than or equal to the IPv6 router advertisement lifetime if the ASA is configured as a default router. For more information, see the <a href="#">“Configuring the Router Lifetime Value” section on page 28-8</a> . To prevent synchronization with other IPv6 nodes, randomly adjust the actual value used to within 20 percent of the desired value. |
| <b>Example:</b><br><code>hostname (config-if)# ipv6 nd ra-interval 201</code> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Examples

The following example configures an IPv6 router advertisement interval of 201 seconds for the selected interface, GigabitEthernet 0/0:

```
hostname (config)# interface gigabitethernet 0/0
hostname (config-if)# ipv6 nd ra-interval 201
```

# Configuring the Router Lifetime Value

To configure the router lifetime value in IPv6 router advertisements on an interface, enter the following command:

| Command                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ipv6 nd ra-lifetime</b> [msec] <i>value</i>                    | Specifies the length of time that nodes on the local link should consider the ASA as the default router on the link.                                                                                                                                                                                                                                          |
| <b>Example:</b><br>hostname (config-if)# ipv6 nd ra-lifetime 2000 | <p>The optional <b>msec</b> keyword indicates that the value provided is in milliseconds. If this keyword is not present, the value provided is in seconds.</p> <p>Valid values for the <i>value</i> argument range from 0 to 9000 seconds.</p> <p>Entering 0 indicates that the ASA should not be considered a default router on the selected interface.</p> |

## Examples

The following example configures an IPv6 router lifetime value of 2000 seconds for the selected interface, GigabitEthernet 0/0:

```
hostname (config)# interface gigabitethernet 0/0
hostname (config-if)# ipv6 nd ra-lifetime 2000
```

# Configuring Duplicate Address Detection Settings

To specify DAD settings on the interface, enter the following command:

| Command                                                          | Purpose                                                                                                                                                                |
|------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ipv6 nd dad attempts</b> <i>value</i>                         | Specifies the uniqueness of new unicast IPv6 addresses before they are assigned and ensures that duplicate IPv6 addresses are detected in the network on a link basis. |
| <b>Example:</b><br>hostname (config-if)# ipv6 nd dad attempts 20 | Valid values for the <i>value</i> argument range from 0 to 600. A zero value disables DAD processing on the specified interface.                                       |

## Examples

The following example configures a DAD attempt value of 20 for the selected interface, GigabitEthernet 0/0:

```
hostname (config)# interface gigabitethernet 0/0
hostname (config-if)# ipv6 nd dad attempts 20
```

# Configuring IPv6 Addresses on an Interface

To configure IPv6 addresses on an interface, enter the following command:

| Command                                                                                  | Purpose                                                |
|------------------------------------------------------------------------------------------|--------------------------------------------------------|
| <b>ipv6 address</b>                                                                      | Specifies the IPv6 address for the selected interface. |
| <b>Example:</b><br>hostname (config-if)# <b>ipv6 address</b><br>fe80::20d:88ff:feee:6a82 |                                                        |

## Examples

The following example configures a link-local IPv6 address for the selected interface, GigabitEthernet 0/0:

```
hostname (config)# interface gigabitethernet 0/0
hostname (config-if)# ipv6 address fe80::20d:88ff:feee:6a82
```

# Suppressing Router Advertisement Messages

Router advertisement messages are automatically sent in response to router solicitation messages. You may want to disable these messages on any interface for which you do not want the ASA to supply the IPv6 prefix (for example, the outside interface).

To suppress the router lifetime value in IPv6 router advertisements on an interface, enter the following command:

| Command                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ipv6 nd suppress-ra</b> <i>seconds</i>                                                     | Suppresses the router lifetime value.                                                                                                                                                                                                                                                                                                                                       |
| <b>Example:</b><br>hostname (config-if)# <b>ipv6 nd suppress-ra</b><br>2001:DB8::/32 1000 900 |                                                                                                                                                                                                                                                                                                                                                                             |
|                                                                                               | The <i>seconds</i> argument specifies the validity of the ASA as a default router on this interface. Valid values range from 0 to 9000 seconds. A zero indicates that the ASA should not be considered a default router on the specified interface.<br><br>Entering this command causes the ASA to appear as a regular IPv6 neighbor on the link and not as an IPv6 router. |

## Examples

The following example suppresses an IPv6 router advertisement transmission for the specified interface, which is GigabitEthernet 0/0:

```
hostname (config)# interface gigabitethernet 0/0
hostname (config-if)# ipv6 nd suppress-ra 2001:DB8::/32 1000 900
```

# Configuring the IPv6 Prefix

To configure the which IPv6 prefixes are included in IPv6 router advertisements, enter the following command:

| Command                                                                                                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ipv6 nd prefix</b> <i>ipv6-prefix/prefix-length</i>   <b>default</b> [[ <i>valid-lifetime</i>   <i>preferred-lifetime</i> ]   [ <b>at</b> <i>valid-date</i>   <i>preferred-date</i> ]   <b>infinite</b>   <b>no-advertise</b>   <b>off-link</b>   <b>no-autoconfig</b> ] | <p>Configures which IPv6 prefixes are included in IPv6 router advertisements. The prefix advertisement can be used by neighboring devices to autoconfigure their interface addresses. Stateless autoconfiguration uses IPv6 prefixes provided in router advertisement messages to create the global unicast address from the link-local address.</p> <p>The <b>at</b> <i>valid-date preferred-date</i> syntax indicates the date and time at which the lifetime and preference expire. The prefix is valid until this specified date and time are reached. Dates are expressed in the form <i>date-valid-expire month-valid-expire hh:mm-valid-expire date-prefer-expire month-prefer-expire hh:mm-prefer-expire</i>.</p> <p>The <b>default</b> keyword indicates that default values are used.</p> <p>The optional <b>infinite</b> keyword specifies that the valid lifetime does not expire.</p> <p>The <i>ipv6-prefix</i> argument specifies the IPv6 network number to include in router advertisements. This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.</p> <p>The optional <b>no-advertise</b> keyword indicates to hosts on the local link that the specified prefix is not to be used for IPv6 autoconfiguration.</p> <p>The optional <b>no-autoconfig</b> keyword indicates to hosts on the local link that the specified prefix cannot be used for IPv6 autoconfiguration.</p> <p>The optional <b>off-link</b> keyword indicates that the specified prefix is not used for on-link determination.</p> <p>The <i>preferred-lifetime</i> argument specifies the amount of time (in seconds) that the specified IPv6 prefix is advertised as being preferred. Valid values range from 0 to 4294967295 seconds. The maximum value represents infinity, which can also be specified with infinite. The default is 604800 (7 days).</p> <p>The <i>prefix-length</i> argument specifies the length of the IPv6 prefix. This value indicates how many of the high-order, contiguous bits of the address comprise the network portion of the prefix. The slash (/) must precede the prefix length.</p> <p>The <i>valid-lifetime</i> argument specifies the amount of time that the specified IPv6 prefix is advertised as being valid. Valid values range from 0 to 4294967295 seconds. The maximum value represents infinity, which can also be specified with infinite. The default is 2592000 (30 days).</p> |

## Example:

```
hostname (config-if)# ipv6 nd prefix
2001:DB8::/32 1000 900
```

Examples

The following example includes the IPv6 prefix 2001:DB8::/32, with a valid lifetime of 1000 seconds and a preferred lifetime of 900 seconds, in router advertisements sent out on the specified interface, which is GigabitEthernet 0/0:

```
hostname (config)# interface gigabitethernet 0/0
hostname (config-if)# ipv6 nd prefix 2001:DB8::/32 1000 900
```

# Configuring a Static IPv6 Neighbor

To configure a static entry in the IPv6 neighbor discovery cache, enter the following command:

| Command                                                                                | Purpose                                                                                                                                                                                                                                                  |
|----------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ipv6 neighbor ipv6_address if_name mac_address</code>                            | Configures a static entry in the IPv6 neighbor discovery cache.                                                                                                                                                                                          |
| <b>Example:</b><br>hostname(config-if)# ipv6 neighbor 3001:1::45A inside 002.7D1A.9472 | The <i>ipv6_address</i> argument is the link-local IPv6 address of the neighbor, the <i>if_name</i> argument is the interface through which the neighbor is available, and the <i>mac_address</i> argument is the MAC address of the neighbor interface. |

Examples

The following example adds a static entry for an inside host with an IPv6 address of 3001:1::45A and a MAC address of 002.7D1a.9472 to the neighbor discovery cache:

```
hostname(config-if)# ipv6 neighbor 3001:1::45A inside 002.7D1A.9472
```

# Monitoring IPv6 Neighbor Discovery

To monitor IPv6 neighbor discovery parameters, enter the following command:

| Command                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>show ipv6 interface</code> | <p>Displays the usability status of interfaces configured for IPv6. Including the interface name, such as “outside” and displays the settings for the specified interface. Excludes the name from the command and displays the settings for all interfaces that have IPv6 enabled on them. Output for the command shows the following:</p> <ul style="list-style-type: none"><li>• The name and status of the interface.</li><li>• The link-local and global unicast addresses.</li><li>• The multicast groups to which the interface belongs.</li><li>• ICMP redirect and error message settings.</li><li>• Neighbor discovery settings.</li><li>• The actual time when the command is set to 0.</li><li>• The neighbor discovery reachable time that is being used.</li></ul> |

## **PART 7**

### **Configuring Network Address Translation**

# CHAPTER 29

## Information About NAT

---

This chapter provides an overview of how Network Address Translation (NAT) works on the ASA. This chapter includes the following sections:

- [Why Use NAT?, page 29-1](#)
- [NAT Terminology, page 29-2](#)
- [NAT Types, page 29-3](#)
- [NAT in Routed and Transparent Mode, page 29-12](#)
- [NAT for VPN, page 29-14](#)
- [How NAT is Implemented, page 29-16](#)
- [NAT Rule Order, page 29-20](#)
- [Routing NAT Packets, page 29-21](#)
- [DNS and NAT, page 29-24](#)
- [Where to Go Next, page 29-27](#)

**Note**

To start configuring NAT, see [Chapter 30, “Configuring Network Object NAT,”](#) or [Chapter 31, “Configuring Twice NAT.”](#)

---

## Why Use NAT?

Each computer and device within an IP network is assigned a unique IP address that identifies the host. Because of a shortage of public IPv4 addresses, most of these IP addresses are private, not routable anywhere outside of the private company network. RFC 1918 defines the private IP addresses you can use internally that should not be advertised:

- 10.0.0.0 through 10.255.255.255
- 172.16.0.0 through 172.31.255.255
- 192.168.0.0 through 192.168.255.255

One of the main functions of NAT is to enable private IP networks to connect to the Internet. NAT replaces a private IP address with a public IP address, translating the private addresses in the internal private network into legal, routable addresses that can be used on the public Internet. In this way, NAT conserves public addresses because it can be configured to advertise at a minimum only one public address for the entire network to the outside world.

Other functions of NAT include:

- Security—Keeping internal IP addresses hidden discourages direct attacks.
- IP routing solutions—Overlapping IP addresses are not a problem when you use NAT.
- Flexibility—You can change internal IP addressing schemes without affecting the public addresses available externally; for example, for a server accessible to the Internet, you can maintain a fixed IP address for Internet use, but internally, you can change the server address.

**Note**

NAT is not required. If you do not configure NAT for a given set of traffic, that traffic will not be translated, but will have all of the security policies applied as normal.

## NAT Terminology

This document uses the following terminology:

- Real address/host/network/interface—The real address is the address that is defined on the host, before it is translated. In a typical NAT scenario where you want to translate the inside network when it accesses the outside, the inside network would be the “real” network. Note that you can translate any network connected to the ASA, not just an inside network. Therefore if you configure NAT to translate outside addresses, “real” can refer to the outside network when it accesses the inside network.
- Mapped address/host/network/interface—The mapped address is the address that the real address is translated to. In a typical NAT scenario where you want to translate the inside network when it accesses the outside, the outside network would be the “mapped” network.
- Bidirectional initiation—Static NAT allows connections to be initiated *bidirectionally*, meaning both to the host and from the host.
- Source and destination NAT—For any given packet, both the source and destination IP addresses are compared to the NAT rules, and one or both can be translated/untranslated. For static NAT, the rule is bidirectional, so be aware that “source” and “destination” are used in commands and descriptions throughout this guide even though a given connection might originate at the “destination” address.

# NAT Types

- [NAT Types Overview, page 29-3](#)
- [Static NAT, page 29-3](#)
- [Dynamic NAT, page 29-8](#)
- [Dynamic PAT, page 29-10](#)
- [Identity NAT, page 29-11](#)

## NAT Types Overview

You can implement NAT using the following methods:

- **Static NAT**—A consistent mapping between a real and mapped IP address. Allows bidirectional traffic initiation. See the [“Static NAT” section on page 29-3](#).
- **Dynamic NAT**—A group of real IP addresses are mapped to a (usually smaller) group of mapped IP addresses, on a first come, first served basis. Only the real host can initiate traffic. See the [“Dynamic NAT” section on page 29-8](#).
- **Dynamic Port Address Translation (PAT)**—A group of real IP addresses are mapped to a single IP address using a unique source port of that IP address. See the [“Dynamic PAT” section on page 29-10](#).
- **Identity NAT**—A real address is statically translated to itself, essentially bypassing NAT. You might want to configure NAT this way when you want to translate a large group of addresses, but then want to exempt a smaller subset of addresses. See the [“Identity NAT” section on page 29-11](#).

## Static NAT

This section describes static NAT and includes the following topics:

- [Information About Static NAT, page 29-3](#)
- [Information About Static NAT with Port Translation, page 29-4](#)
- [Information About One-to-Many Static NAT, page 29-6](#)
- [Information About Other Mapping Scenarios \(Not Recommended\), page 29-7](#)

## Information About Static NAT

Static NAT creates a fixed translation of a real address to a mapped address. Because the mapped address is the same for each consecutive connection, static NAT allows bidirectional connection initiation, both to and from the host (if an access rule exists that allows it). With dynamic NAT and PAT, on the other hand, each host uses a different address or port for each subsequent translation, so bidirectional initiation is not supported.

Figure 29-1 shows a typical static NAT scenario. The translation is always active so both real and remote hosts can initiate connections.

**Figure 29-1 Static NAT**

## Information About Static NAT with Port Translation

Static NAT with port translation lets you specify a real and mapped protocol (TCP or UDP) and port.

This section includes the following topics:

- [Information About Static NAT with Port Address Translation, page 29-4](#)
- [Static NAT with Identity Port Translation, page 29-5](#)
- [Static NAT with Port Translation for Non-Standard Ports, page 29-5](#)
- [Static Interface NAT with Port Translation, page 29-5](#)

## Information About Static NAT with Port Address Translation

When you specify the port with static NAT, you can choose to map the port and/or the IP address to the same value or to a different value.

Figure 29-2 shows a typical static NAT with port translation scenario showing both a port that is mapped to itself and a port that is mapped to a different value; the IP address is mapped to a different value in both cases. The translation is always active so both translated and remote hosts can initiate connections.

**Figure 29-2 Typical Static NAT with Port Translation Scenario**

### Note

For applications that require application inspection for secondary channels (for example, FTP and VoIP), the ASA automatically translates the secondary ports.

## Static NAT with Identity Port Translation

The following static NAT with port translation example provides a single address for remote users to access FTP, HTTP, and SMTP. These servers are actually different devices on the real network, but for each server, you can specify static NAT with port translation rules that use the same mapped IP address, but different ports. (See [Figure 29-3](#). See the “[Single Address for FTP, HTTP, and SMTP \(Static NAT-with-Port-Translation\)](#)” section on [page 30-18](#) for details on how to configure this example.)

**Figure 29-3** Static NAT with Port Translation

## Static NAT with Port Translation for Non-Standard Ports

You can also use static NAT with port translation to translate a well-known port to a non-standard port or vice versa. For example, if inside web servers use port 8080, you can allow outside users to connect to port 80, and then undo translation to the original port 8080. Similarly, to provide extra security, you can tell web users to connect to non-standard port 6785, and then undo translation to port 80.

## Static Interface NAT with Port Translation

You can configure static NAT to map a real address to an interface address/port combination. For example, if you want to redirect Telnet access for the ASA outside interface to an inside host, then you can map the inside host IP address/port 23 to the ASA interface address/port 23. (Note that although Telnet to the ASA is not allowed to the lowest security interface, static NAT with interface port translation redirects the Telnet session instead of denying it).

## Information About One-to-Many Static NAT

Typically, you configure static NAT with a one-to-one mapping. However, in some cases, you might want to configure a single real address to several mapped addresses (one-to-many). When you configure one-to-many static NAT, when the real host initiates traffic, it always uses the first mapped address. However, for traffic initiated to the host, you can initiate traffic to any of the mapped addresses, and they will be untranslated to the single real address.

Figure 29-4 shows a typical one-to-many static NAT scenario. Because initiation by the real host always uses the first mapped address, the translation of real host IP/1st mapped IP is technically the only bidirectional translation.

**Figure 29-4** One-to-Many Static NAT

For example, you have a load balancer at 10.1.2.27. Depending on the URL requested, it redirects traffic to the correct web server (see Figure 29-5). (See the “[Inside Load Balancer with Multiple Mapped Addresses \(Static NAT, One-to-Many\)](#)” section on page 30-17 for details on how to configure this example.)

**Figure 29-5** One-to-Many Static NAT

248633

## Information About Other Mapping Scenarios (Not Recommended)

The ASA has the flexibility to allow any kind of static mapping scenario: one-to-one, one-to-many, but also few-to-many, many-to-few, and many-to-one mappings. We recommend using only one-to-one or one-to-many mappings. These other mapping options might result in unintended consequences.

Functionally, few-to-many is the same as one-to-many; but because the configuration is more complicated and the actual mappings may not be obvious at a glance, we recommend creating a one-to-many configuration for each real address that requires it. For example, for a few-to-many scenario, the few real addresses are mapped to the many mapped addresses in order (A to 1, B to 2, C to 3). When all real addresses are mapped, the next mapped address is mapped to the first real address, and so on until all mapped addresses are mapped (A to 4, B to 5, C to 6). This results in multiple mapped addresses for each real address. Just like a one-to-many configuration, only the first mappings are bidirectional; subsequent mappings allow traffic to be initiated *to* the real host, but all traffic *from* the real host uses only the first mapped address for the source.

Figure 29-6 shows a typical few-to-many static NAT scenario.

**Figure 29-6 Few-to-Many Static NAT**

For a many-to-few or many-to-one configuration, where you have more real addresses than mapped addresses, you run out of mapped addresses before you run out of real addresses. Only the mappings between the lowest real IP addresses and the mapped pool result in bidirectional initiation. The remaining higher real addresses can initiate traffic, but traffic cannot be initiated to them (returning traffic for a connection is directed to the correct real address because of the unique 5-tuple (source IP, destination IP, source port, destination port, protocol) for the connection).

**Note**

Many-to-few or many-to-one NAT is not PAT. If two real hosts use the same source port number and go to the same outside server and the same TCP destination port, and both hosts are translated to the same IP address, then both connections will be reset because of an address conflict (the 5-tuple is not unique).

Figure 29-7 shows a typical many-to-few static NAT scenario.

**Figure 29-7 Many-to-Few Static NAT**

Instead of using a static rule this way, we suggest that you create a one-to-one rule for the traffic that needs bidirectional initiation, and then create a dynamic rule for the rest of your addresses.

## Dynamic NAT

This section describes dynamic NAT and includes the following topics:

- [Information About Dynamic NAT, page 29-9](#)
- [Dynamic NAT Disadvantages and Advantages, page 29-10](#)

## Information About Dynamic NAT

Dynamic NAT translates a group of real addresses to a pool of mapped addresses that are routable on the destination network. The mapped pool typically includes fewer addresses than the real group. When a host you want to translate accesses the destination network, the ASA assigns the host an IP address from the mapped pool. The translation is created only when the real host initiates the connection. The translation is in place only for the duration of the connection, and a given user does not keep the same IP address after the translation times out. Users on the destination network, therefore, cannot initiate a reliable connection to a host that uses dynamic NAT, even if the connection is allowed by an access rule.

Figure 29-8 shows a typical dynamic NAT scenario. Only real hosts can create a NAT session, and responding traffic is allowed back.

**Figure 29-8** *Dynamic NAT*

Figure 29-9 shows a remote host attempting to initiate a connection to a mapped address. This address is not currently in the translation table; therefore, the ASA drops the packet.

**Figure 29-9** *Remote Host Attempts to Initiate a Connection to a Mapped Address*

**Note**

For the duration of the translation, a remote host can initiate a connection to the translated host if an access rule allows it. Because the address is unpredictable, a connection to the host is unlikely. Nevertheless, in this case you can rely on the security of the access rule.

## Dynamic NAT Disadvantages and Advantages

Dynamic NAT has these disadvantages:

- If the mapped pool has fewer addresses than the real group, you could run out of addresses if the amount of traffic is more than expected.

Use PAT or a PAT fallback method if this event occurs often because PAT provides over 64,000 translations using ports of a single address.

- You have to use a large number of routable addresses in the mapped pool, and routable addresses may not be available in large quantities.

The advantage of dynamic NAT is that some protocols cannot use PAT. PAT does not work with the following:

- IP protocols that do not have a port to overload, such as GRE version 0.
- Some multimedia applications that have a data stream on one port, the control path on another port, and are not open standard.

See the [“Default Settings” section on page 42-4](#) for more information about NAT and PAT support.

## Dynamic PAT

This section describes dynamic PAT and includes the following topics:

- [Information About Dynamic PAT, page 29-10](#)
- [Dynamic PAT Disadvantages and Advantages, page 29-11](#)

## Information About Dynamic PAT

Dynamic PAT translates multiple real addresses to a single mapped IP address by translating the real address and source port to the mapped address and a unique port. If available, the real source port number is used for the mapped port. However, if the real port is *not* available, by default the mapped ports are chosen from the same range of ports as the real port number: 0 to 511, 512 to 1023, and 1024 to 65535. Therefore, ports below 1024 have only a small PAT pool that can be used. (8.4(3) and later, not including 8.5(1)) If you have a lot of traffic that uses the lower port ranges, you can now specify a flat range of ports to be used instead of the three unequal-sized tiers.

Each connection requires a separate translation session because the source port differs for each connection. For example, 10.1.1.1:1025 requires a separate translation from 10.1.1.1:1026.

Figure 29-10 shows a typical dynamic PAT scenario. Only real hosts can create a NAT session, and responding traffic is allowed back. The mapped address is the same for each translation, but the port is dynamically assigned.

**Figure 29-10** Dynamic PAT

After the connection expires, the port translation also expires after 30 seconds of inactivity. The timeout is not configurable. Users on the destination network cannot reliably initiate a connection to a host that uses PAT (even if the connection is allowed by an access rule).

**Note**

For the duration of the translation, a remote host can initiate a connection to the translated host if an access rule allows it. Because the port address (both real and mapped) is unpredictable, a connection to the host is unlikely. Nevertheless, in this case you can rely on the security of the access rule.

## Dynamic PAT Disadvantages and Advantages

Dynamic PAT lets you use a single mapped address, thus conserving routable addresses. You can even use the ASA interface IP address as the PAT address.

Dynamic PAT does not work with some multimedia applications that have a data stream that is different from the control path. See the “Default Settings” section on page 42-4 for more information about NAT and PAT support.

Dynamic PAT may also create a large number of connections appearing to come from a single IP address, and servers might interpret the traffic as a DoS attack. (8.4(2)/8.5(1) and later) You can configure a PAT pool of addresses and use a round-robin assignment of PAT addresses to mitigate this situation.

## Identity NAT

You might have a NAT configuration in which you need to translate an IP address to itself. For example, if you create a broad rule that applies NAT to every network, but want to exclude one network from NAT, you can create a static NAT rule to translate an address to itself. Identity NAT is necessary for remote access VPN, where you need to exempt the client traffic from NAT.

Figure 29-11 shows a typical identity NAT scenario.

**Figure 29-11** Identity NAT

## NAT in Routed and Transparent Mode

You can configure NAT in both routed and transparent firewall mode. This section describes typical usage for each firewall mode and includes the following topics:

- [NAT in Routed Mode, page 29-13](#)
- [NAT in Transparent Mode, page 29-13](#)

## NAT in Routed Mode

Figure 29-12 shows a typical NAT example in routed mode, with a private network on the inside.

**Figure 29-12 NAT Example: Routed Mode**

1. When the inside host at 10.1.2.27 sends a packet to a web server, the real source address of the packet, 10.1.2.27, is changed to a mapped address, 209.165.201.10.
2. When the server responds, it sends the response to the mapped address, 209.165.201.10, and the ASA receives the packet because the ASA performs proxy ARP to claim the packet.
3. The ASA then changes the translation of the mapped address, 209.165.201.10, back to the real address, 10.1.2.27, before sending it to the host.

## NAT in Transparent Mode

Using NAT in transparent mode eliminates the need for the upstream or downstream routers to perform NAT for their networks.

NAT in transparent mode has the following requirements and limitations:

- Because the transparent firewall does not have any interface IP addresses, you cannot use interface PAT.
- ARP inspection is not supported. Moreover, if for some reason a host on one side of the ASA sends an ARP request to a host on the other side of the ASA, and the initiating host real address is mapped to a different address on the same subnet, then the real address remains visible in the ARP request.

Figure 29-13 shows a typical NAT scenario in transparent mode, with the same network on the inside and outside interfaces. The transparent firewall in this scenario is performing the NAT service so that the upstream router does not have to perform NAT.

**Figure 29-13 NAT Example: Transparent Mode**

1. When the inside host at 10.1.1.75 sends a packet to a web server, the real source address of the packet, 10.1.1.75, is changed to a mapped address, 209.165.201.15.
2. When the server responds, it sends the response to the mapped address, 209.165.201.15, and the ASA receives the packet because the upstream router includes this mapped network in a static route directed to the ASA management IP address. See the [“Mapped Addresses and Routing”](#) section on page 29-22 for more information about required routes.
3. The ASA then undoes the translation of the mapped address, 209.165.201.15, back to the real address, 10.1.1.1.75. Because the real address is directly-connected, the ASA sends it directly to the host.
4. For host 192.168.1.2, the same process occurs, except for returning traffic, the ASA looks up the route in its routing table and sends the packet to the downstream router at 10.1.1.3 based on the ASA static route for 192.168.1.0/24. See the [“Transparent Mode Routing Requirements for Remote Networks”](#) section on page 29-24 for more information about required routes.

## NAT for VPN

If you do not allow split-tunneling, then all VPN traffic, even traffic destined for the Internet, goes through the VPN tunnel. VPN traffic, after being decrypted by the ASA, is essentially the same as any other inside traffic: when an inside user needs to access the Internet, they need a public IP address provided by NAT.

Figure 29-14 shows a VPN client that wants to visit a website at [www.example.com](http://www.example.com). In this example, an interface PAT rule on the outside interface matches the VPN-assigned address 10.1.1.10. With intra-interface communication enabled, traffic can exit the same interface it entered to reach [www.example.com](http://www.example.com). A similar example without the need for hairpin networking includes an ASA for VPN termination, and a separate ASA with NAT as the Internet gateway.

**Figure 29-14 Interface PAT for Internet-Bound VPN Traffic (Hairpin, Intra-Interface)**

331396

Figure 29-15 also shows an interface PAT rule for Internet-bound traffic. However, for any communication between VPN endpoints such as the ends of a site-to-site tunnel, you do not want to perform NAT. Therefore you also need to create an identity NAT rule (using twice NAT) for any traffic that goes to other inside networks connected by VPN.

**Figure 29-15 Identity NAT to Allow Communication Between VPN Sites and Clients**

331395

# How NAT is Implemented

The ASA can implement address translation in two ways: *network object NAT* and *twice NAT*. This section includes the following topics:

- [Main Differences Between Network Object NAT and Twice NAT, page 29-16](#)
- [Information About Network Object NAT, page 29-17](#)
- [Information About Twice NAT, page 29-17](#)

## Main Differences Between Network Object NAT and Twice NAT

The main differences between these two NAT types are:

- How you define the real address.
  - Network object NAT—You define NAT as a parameter for a network object. A network object names an IP host, range, or subnet so you can then use the object in configuration instead of the actual IP addresses. The network object IP address serves as the real address. This method lets you easily add NAT to network objects that might already be used in other parts of your configuration.
  - Twice NAT—You identify a network object or network object group for both the real and mapped addresses. In this case, NAT is not a parameter of the network object; the network object or group is a parameter of the NAT configuration. The ability to use a network object *group* for the real address means that twice NAT is more scalable.
- How source and destination NAT is implemented.
  - Network object NAT—Each rule can apply to either the source or destination of a packet. So two rules might be used, one for the source IP address, and one for the destination IP address. These two rules cannot be tied together to enforce a specific translation for a source/destination combination.
  - Twice NAT—A single rule translates both the source and destination. A matching packet only matches the one rule, and further rules are not checked. Even if you do not configure the optional destination address for twice NAT, a matching packet still only matches one twice NAT rule. The source and destination are tied together, so you can enforce different translations depending on the source/destination combination. For example, sourceA/destinationA can have a different translation than sourceA/destinationB.
- Order of NAT Rules.
  - Network object NAT—Automatically ordered in the NAT table.
  - Twice NAT—Manually ordered in the NAT table (before or after network object NAT rules).

See the [“NAT Rule Order” section on page 29-20](#) for more information.

We recommend using network object NAT unless you need the extra features that twice NAT provides. Network object NAT is easier to configure, and might be more reliable for applications such as Voice over IP (VoIP). (For VoIP, because twice NAT is applicable only between two objects, you might see a failure in the translation of indirect addresses that do not belong to either of the objects.)

## Information About Network Object NAT

All NAT rules that are configured as a parameter of a network object are considered to be *network object NAT* rules. Network object NAT is a quick and easy way to configure NAT for a network object, which can be a single IP address, a range of addresses, or a subnet.

After you configure the network object, you can then identify the mapped address for that object, either as an inline address or as another network object or network object group.

When a packet enters the ASA, both the source and destination IP addresses are checked against the network object NAT rules. The source and destination address in the packet can be translated by separate rules if separate matches are made. These rules are not tied to each other; different combinations of rules can be used depending on the traffic.

Because the rules are never paired, you cannot specify that sourceA/destinationA should have a different translation than sourceA/destinationB. Use twice NAT for that kind of functionality (twice NAT lets you identify the source and destination address in a single rule).

To start configuring network object NAT, see [Chapter 30, “Configuring Network Object NAT.”](#)

## Information About Twice NAT

Twice NAT lets you identify both the source and destination address in a single rule. Specifying both the source and destination addresses lets you specify that sourceA/destinationA can have a different translation than sourceA/destinationB.

The destination address is optional. If you specify the destination address, you can either map it to itself (identity NAT), or you can map it to a different address. The destination mapping is always a static mapping.

Twice NAT also lets you use service objects for static NAT with port translation; network object NAT only accepts inline definition.

To start configuring twice NAT, see [Chapter 31, “Configuring Twice NAT.”](#)

[Figure 29-16](#) shows a host on the 10.1.2.0/24 network accessing two different servers. When the host accesses the server at 209.165.201.11, the real address is translated to 209.165.202.129. When the host accesses the server at 209.165.200.225, the real address is translated to 209.165.202.130. (See the [“Single Address for FTP, HTTP, and SMTP \(Static NAT-with-Port-Translation\)”](#) section on page 30-18 for details on how to configure this example.)

**Figure 29-16** Twice NAT with Different Destination Addresses

Figure 29-17 shows the use of source and destination ports. The host on the 10.1.2.0/24 network accesses a single host for both web services and Telnet services. When the host accesses the server for web services, the real address is translated to 209.165.202.129. When the host accesses the same server for Telnet services, the real address is translated to 209.165.202.130.

**Figure 29-17** Twice NAT with Different Destination Ports

Figure 29-18 shows a remote host connecting to a mapped host. The mapped host has a twice static NAT translation that translates the real address only for traffic to and from the 209.165.201.0/27 network. A translation does not exist for the 209.165.200.224/27 network, so the translated host cannot connect to that network, nor can a host on that network connect to the translated host.

**Figure 29-18** *Twice Static NAT with Destination Address Translation*

# NAT Rule Order

Network object NAT rules and twice NAT rules are stored in a single table that is divided into three sections. Section 1 rules are applied first, then section 2, and finally section 3. [Table 29-1](#) shows the order of rules within each section.

**Table 29-1 NAT Rule Table**

| Table Section | Rule Type          | Order of Rules within the Section                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Section 1     | Twice NAT          | <p>Applied on a first match basis, in the order they appear in the configuration. By default, twice NAT rules are added to section 1.</p> <p><b>Note</b> If you configure EasyVPN remote, the ASA dynamically adds invisible NAT rules to the end of this section. Be sure that you do not configure a twice NAT rule in this section that might match your VPN traffic, instead of matching the invisible rule. If VPN does not work due to NAT failure, consider adding twice NAT rules to section 3 instead.</p>                                                                                                                                                                                                                                                                                                     |
| Section 2     | Network object NAT | <p>Section 2 rules are applied in the following order, as automatically determined by the ASA:</p> <ol style="list-style-type: none"> <li>1. Static rules.</li> <li>2. Dynamic rules.</li> </ol> <p>Within each rule type, the following ordering guidelines are used:</p> <ol style="list-style-type: none"> <li>a. Quantity of real IP addresses—From smallest to largest. For example, an object with one address will be assessed before an object with 10 addresses.</li> <li>b. For quantities that are the same, then the IP address number is used, from lowest to highest. For example, 10.1.1.0 is assessed before 11.1.1.0.</li> <li>c. If the same IP address is used, then the name of the network object is used, in alphabetical order. For example, abracadabra is assessed before catwoman.</li> </ol> |
| Section 3     | Twice NAT          | <p>Section 3 rules are applied on a first match basis, in the order they appear in the configuration. You can specify whether to add a twice NAT rule to section 3 when you add the rule.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

For section 2 rules, for example, you have the following IP addresses defined within network objects:

```

192.168.1.0/24 (static)
192.168.1.0/24 (dynamic)
10.1.1.0/24 (static)
192.168.1.1/32 (static)
172.16.1.0/24 (dynamic) (object def)
172.16.1.0/24 (dynamic) (object abc)

```

The resultant ordering would be:

```
192.168.1.1/32 (static)
10.1.1.0/24 (static)
192.168.1.0/24 (static)
172.16.1.0/24 (dynamic) (object abc)
172.16.1.0/24 (dynamic) (object def)
192.168.1.0/24 (dynamic)
```

## NAT Interfaces

You can configure a NAT rule to apply to any interface (in other words, all interfaces), or you can identify specific real and mapped interfaces. You can also specify any interface for the real address, and a specific interface for the mapped address, or vice versa.

For example, you might want to specify any interface for the real address and specify the outside interface for the mapped address if you use the same private addresses on multiple interfaces, and you want to translate them all to the same global pool when accessing the outside (Figure 29-19).

**Figure 29-19** Specifying Any Interface

**Note**

For transparent mode, you must choose specific source and destination interfaces.

## Routing NAT Packets

The ASA needs to be the destination for any packets sent to the mapped address. The ASA also needs to determine the egress interface for translated packets. This section describes how the ASA handles accepting and delivering packets with NAT, and includes the following topics:

- [Mapped Addresses and Routing, page 29-22](#)
- [Transparent Mode Routing Requirements for Remote Networks, page 29-24](#)
- [Determining the Egress Interface, page 29-24](#)

## Mapped Addresses and Routing

When you translate the real address to a mapped address, the mapped address you choose determines how to configure routing, if necessary, for the mapped address.

See additional guidelines about mapped IP addresses in [Chapter 30, “Configuring Network Object NAT,”](#) and [Chapter 31, “Configuring Twice NAT.”](#)

See the following mapped address types:

- Addresses on the same network as the mapped interface.

If you use addresses on the same network as the mapped interface, the ASA uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the ASA does not have to be the gateway for any additional networks. This solution is ideal if the outside network contains an adequate number of free addresses, a consideration if you are using a 1:1 translation like dynamic NAT or static NAT. Dynamic PAT greatly extends the number of translations you can use with a small number of addresses, so even if the available addresses on the outside network is small, this method can be used. For PAT, you can even use the IP address of the mapped interface.

**Note**

If you configure the mapped interface to be any interface, and you specify a mapped address on the same network as one of the mapped interfaces, then if an ARP request for that mapped address comes in on a *different* interface, then you need to manually configure an ARP entry for that network on the ingress interface, specifying its MAC address (see the **arp** command). Typically, if you specify any interface for the mapped interface, then you use a unique network for the mapped addresses, so this situation would not occur.

- Addresses on a unique network.

If you need more addresses than are available on the mapped interface network, you can identify addresses on a different subnet. The upstream router needs a static route for the mapped addresses that points to the ASA. Alternatively for routed mode, you can configure a static route on the ASA for the mapped addresses, and then redistribute the route using your routing protocol. For transparent mode, if the real host is directly-connected, configure the static route on the upstream router to point to the ASA: in 8.3, specify the global management IP address; in 8.4(1) and later, specify the bridge group IP address. For remote hosts in transparent mode, in the static route on the upstream router, you can alternatively specify the downstream router IP address.

- The same address as the real address (identity NAT).

(8.3(1), 8.3(2), and 8.4(1)) The default behavior for identity NAT has proxy ARP disabled. You cannot configure this setting.

(8.4(2) and later) The default behavior for identity NAT has proxy ARP enabled, matching other static NAT rules. You can disable proxy ARP if desired. **Note:** You can also disable proxy ARP for regular static NAT if desired, in which case you need to be sure to have proper routes on the upstream router.

Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues. For example, if you configure a broad identity NAT rule for “any” IP address, then leaving proxy ARP enabled can cause problems for hosts on the network directly-connected to the mapped interface. In this case, when a host on the mapped network wants to communicate with another host on the same network, then the address in the ARP request matches the NAT rule (which matches “any” address). The ASA will then proxy ARP for the address, even though the packet is not actually destined for the ASA. (Note that this problem occurs even if you have a twice NAT rule; although

the NAT rule must match both the source and destination addresses, the proxy ARP decision is made only on the “source” address). If the ASA ARP response is received before the actual host ARP response, then traffic will be mistakenly sent to the ASA (see [Figure 29-20](#)).

**Figure 29-20 Proxy ARP Problems with Identity NAT**

In rare cases, you need proxy ARP for identity NAT; for example for virtual Telnet. When using AAA for network access, a host needs to authenticate with the ASA using a service like Telnet before any other traffic can pass. You can configure a virtual Telnet server on the ASA to provide the necessary login. When accessing the virtual Telnet address from the outside, you must configure an identity NAT rule for the address specifically for the proxy ARP functionality. Due to internal processes for virtual Telnet, proxy ARP lets the ASA keep traffic destined for the virtual Telnet address rather than send the traffic out the source interface according to the NAT rule. (See [Figure 29-21](#)).

**Figure 29-21 Proxy ARP and Virtual Telnet**

## Transparent Mode Routing Requirements for Remote Networks

If the ASA performs NAT for a host that is not on the directly-connected network, then you need to configure a static route on the ASA for that network. You also need to have a static route for embedded IP addresses that are at least one hop away from the ASA (such as in VoIP or DNS traffic) when you have inspection and NAT enabled.

## Determining the Egress Interface

In transparent mode, the ASA determines the egress interface for a NAT packet by using the NAT configuration; you must specify the source and destination interfaces as part of the NAT configuration.

In routed mode, the ASA determines the egress interface for a NAT packet in the following way:

- If you specify an optional interface, then the ASA uses the NAT configuration to determine the egress interface. (8.3(1) through 8.4(1)) The only exception is for identity NAT, which always uses a route lookup, regardless of the NAT configuration. (8.4(2) and later) For identity NAT, the default behavior is to use the NAT configuration, but you have the option to always use a route lookup instead.
- If you do not specify a specific interface, then the ASA uses a route lookup to determine the egress interface.

## DNS and NAT

You might need to configure the ASA to modify DNS replies by replacing the address in the reply with an address that matches the NAT configuration. You can configure DNS modification when you configure each translation rule.

This feature rewrites the A record, or address record, in DNS replies that match a NAT rule. For DNS replies traversing from a mapped interface to any other interface, the A record is rewritten from the mapped value to the real value. Inversely, for DNS replies traversing from any interface to a mapped interface, the A record is rewritten from the real value to the mapped value.

### Note

If you configure a twice NAT rule, you cannot configure DNS modification if you specify the source address as well as the destination address. These kinds of rules can potentially have a different translation for a single address when going to A vs. B. Therefore, the ASA cannot accurately match the IP address inside the DNS reply to the correct twice NAT rule; the DNS reply does not contain information about which source/destination address combination was in the packet that prompted the DNS request.

Figure 29-22 shows a DNS server that is accessible from the outside interface. A server, ftp.cisco.com, is on the inside interface. You configure the ASA to statically translate the ftp.cisco.com real address (10.1.3.14) to a mapped address (209.165.201.10) that is visible on the outside network. In this case, you want to enable DNS reply modification on this static rule so that inside users who have access to ftp.cisco.com using the real address receive the real address from the DNS server, and not the mapped address. When an inside host sends a DNS request for the address of ftp.cisco.com, the DNS server replies with the mapped address (209.165.201.10). The ASA refers to the static rule for the inside server

and translates the address inside the DNS reply to 10.1.3.14. If you do not enable DNS reply modification, then the inside host attempts to send traffic to 209.165.201.10 instead of accessing ftp.cisco.com directly.

**Figure 29-22** DNS Reply Modification, DNS Server on Outside

130021

Figure 29-23 shows a user on the inside network requesting the IP address for ftp.cisco.com, which is on the DMZ network, from an outside DNS server. The DNS server replies with the mapped address (209.165.201.10) according to the static rule between outside and DMZ even though the user is not on the DMZ network. The ASA translates the address inside the DNS reply to 10.1.3.14. If the user needs to access ftp.cisco.com using the real address, then no further configuration is required. If there is also

a static rule between the inside and DMZ, then you also need to enable DNS reply modification on this rule. The DNS reply will then be modified two times. In this case, the ASA again translates the address inside the DNS reply to 192.168.1.10 according to the static rule between inside and DMZ.

**Figure 29-23** DNS Reply Modification, DNS Server, Host, and Server on Separate Networks

Figure 29-24 shows a web server and DNS server on the outside. The ASA has a static translation for the outside server. In this case, when an inside user requests the address for ftp.cisco.com from the DNS server, the DNS server responds with the real address, 209.165.20.10. Because you want inside users to use the mapped address for ftp.cisco.com (10.1.2.56) you need to configure DNS reply modification for the static translation.

**Figure 29-24 DNS Reply Modification, DNS Server on Host Network**

## Where to Go Next

To configure network object NAT, see [Chapter 30, “Configuring Network Object NAT.”](#)

To configure twice NAT, see [Chapter 31, “Configuring Twice NAT.”](#)

# CHAPTER 30

## Configuring Network Object NAT

---

All NAT rules that are configured as a parameter of a network object are considered to be *network object NAT* rules. Network object NAT is a quick and easy way to configure NAT for a single IP address, a range of addresses, or a subnet. After you configure the network object, you can then identify the mapped address for that object.

This chapter describes how to configure network object NAT, and it includes the following sections:

- [Information About Network Object NAT, page 30-1](#)
- [Licensing Requirements for Network Object NAT, page 30-2](#)
- [Prerequisites for Network Object NAT, page 30-2](#)
- [Guidelines and Limitations, page 30-2](#)
- [Default Settings, page 30-3](#)
- [Configuring Network Object NAT, page 30-3](#)
- [Monitoring Network Object NAT, page 30-14](#)
- [Configuration Examples for Network Object NAT, page 30-15](#)
- [Feature History for Network Object NAT, page 30-22](#)

**Note**

For detailed information about how NAT works, see [Chapter 29, “Information About NAT.”](#)

---

## Information About Network Object NAT

When a packet enters the ASA, both the source and destination IP addresses are checked against the network object NAT rules. The source and destination address in the packet can be translated by separate rules if separate matches are made. These rules are not tied to each other; different combinations of rules can be used depending on the traffic.

Because the rules are never paired, you cannot specify that a source address should be translated to A when going to destination X, but be translated to B when going to destination Y. Use twice NAT for that kind of functionality (twice NAT lets you identify the source and destination address in a single rule).

For detailed information about the differences between twice NAT and network object NAT, see the [“How NAT is Implemented”](#) section on page 29-16.

Network object NAT rules are added to section 2 of the NAT rules table. For more information about NAT ordering, see the [“NAT Rule Order”](#) section on page 29-20.

# Licensing Requirements for Network Object NAT

The following table shows the licensing requirements for this feature:

| Model      | License Requirement |
|------------|---------------------|
| All models | Base License.       |

## Prerequisites for Network Object NAT

Depending on the configuration, you can configure the mapped address inline if desired or you can create a separate network object or network object group for the mapped address (the **object network** or **object-group network** command). Network object groups are particularly useful for creating a mapped address pool with discontinuous IP address ranges or multiple hosts or subnets. To create a network object or group, see the [“Configuring Objects and Groups” section on page 13-1](#).

For specific guidelines for objects and groups, see the configuration section for the NAT type you want to configure. See also the [“Guidelines and Limitations”](#) section.

## Guidelines and Limitations

### Context Mode Guidelines

Supported in single and multiple context mode.

### Firewall Mode Guidelines

- Supported in routed and transparent firewall mode.
- In transparent mode, you must specify the real and mapped interfaces; you cannot use **any**.
- In transparent mode, you cannot configure interface PAT, because the transparent mode interfaces do not have IP addresses. You also cannot use the management IP address as a mapped address.

### IPv6 Guidelines

Does not support IPv6.

### Additional Guidelines

- You can only define a single NAT rule for a given object; if you want to configure multiple NAT rules for an object, you need to create multiple objects with different names that specify the same IP address, for example, **object network obj-10.10.10.1-01**, **object network obj-10.10.10.1-02**, and so on.

- If you change the NAT configuration, and you do not want to wait for existing translations to time out before the new NAT configuration is used, you can clear the translation table using the **clear xlate** command. However, clearing the translation table disconnects all current connections that use translations.

**Note**

If you remove a dynamic NAT or PAT rule, and then add a new rule with mapped addresses that overlap the addresses in the removed rule, then the new rule will not be used until all connections associated with the removed rule time out or are cleared using the **clear xlate** command. This safeguard ensures that the same address is not assigned to multiple hosts.

- Objects and object groups used in NAT cannot be undefined; they must include IP addresses.
- You can use the same mapped object or group in multiple NAT rules.
- The mapped IP address pool cannot include:
  - The mapped interface IP address. If you specify **any** interface for the rule, then all interface IP addresses are disallowed. For interface PAT (routed mode only), use the **interface** keyword instead of the IP address.
  - (Transparent mode) The management IP address.
  - (Dynamic NAT) The standby interface IP address when VPN is enabled.
  - Existing VPN pool addresses.
- For application inspection limitations with NAT or PAT, see the [“Default Settings” section on page 42-4 in Chapter 42, “Getting Started with Application Layer Protocol Inspection.”](#)

## Default Settings

- (Routed mode) The default real and mapped interface is Any, which applies the rule to all interfaces.
- (8.3(1), 8.3(2), and 8.4(1)) The default behavior for identity NAT has proxy ARP disabled. You cannot configure this setting. (8.4(2) and later) The default behavior for identity NAT has proxy ARP enabled, matching other static NAT rules. You can disable proxy ARP if desired. See the [“Routing NAT Packets” section on page 29-21](#) for more information.
- If you specify an optional interface, then the ASA uses the NAT configuration to determine the egress interface. (8.3(1) through 8.4(1)) The only exception is for identity NAT, which always uses a route lookup, regardless of the NAT configuration. (8.4(2) and later) For identity NAT, the default behavior is to use the NAT configuration, but you have the option to always use a route lookup instead. See the [“Routing NAT Packets” section on page 29-21](#) for more information.

## Configuring Network Object NAT

This section describes how to configure network object NAT and includes the following topics:

- [Configuring Dynamic NAT, page 30-4](#)
- [Configuring Dynamic PAT \(Hide\), page 30-6](#)
- [Configuring Static NAT or Static NAT-with-Port-Translation, page 30-10](#)
- [Configuring Identity NAT, page 30-12](#)

## Configuring Dynamic NAT

This section describes how to configure network object NAT for dynamic NAT. For more information, see the [“Dynamic NAT” section on page 29-8](#).

### Detailed Steps

|        | Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p>Network object:</p> <pre>object network obj_name   range ip_address_1 ip_address_2</pre> <p>Network object group:</p> <pre>object-group network grp_name {network-object {object net_obj_name   host ip_address}   group-object grp_obj_name}</pre> <p><b>Example:</b></p> <pre>hostname(config)# object network TEST hostname(config-network-object)# range 10.1.1.1 10.1.1.70  hostname(config)# object network TEST2 hostname(config-network-object)# range 10.1.2.1 10.1.2.70  hostname(config-network-object)# object-group network MAPPED_IPS hostname(config-network)# network-object object TEST hostname(config-network)# network-object object TEST2 hostname(config-network)# network-object host 10.1.2.79</pre> | <p>To specify the <b>mapped</b> addresses (that you want to translate to), configure a network object or network object group. A network object group can contain objects and/or inline addresses.</p> <p><b>Note</b> The object or group cannot contain a subnet.</p> <p>If a mapped network object contains both ranges and host IP addresses, then the ranges are used for dynamic NAT, and then the host IP addresses are used as a PAT fallback.</p> <p>See the <a href="#">“Guidelines and Limitations” section on page 30-2</a> for information about disallowed mapped IP addresses.</p> <p>For more information about configuring a network object or group, see the <a href="#">“Configuring Objects” section on page 13-3</a>.</p> |
| Step 2 | <pre>object network obj_name</pre> <p><b>Example:</b></p> <pre>hostname(config)# object network my-host-obj1</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>Configures a network object for which you want to configure NAT, or enters object network configuration mode for an existing network object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 3 | <pre>{host ip_address   subnet subnet_address netmask   range ip_address_1 ip_address_2}</pre> <p><b>Example:</b></p> <pre>hostname(config-network-object)# subnet 10.1.1.0 255.255.255.0</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>If you are creating a new network object, defines the <b>real</b> IP address(es) that you want to translate.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Command                                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Step 4</b></p> <pre>nat [(real_ifc,mapped_ifc)] dynamic mapped_obj [interface] [dns]</pre> <p><b>Example:</b></p> <pre>hostname(config-network-object)# nat (inside,outside) dynamic MAPPED_IPS interface</pre> | <p>Configures <b>dynamic NAT</b> for the object IP addresses.</p> <p><b>Note</b> You can only define a single NAT rule for a given object. See the <a href="#">“Additional Guidelines” section on page 30-2</a>.</p> <p>See the following guidelines:</p> <ul style="list-style-type: none"> <li>• <b>Interfaces</b>—(Required for transparent mode) Specify the real and mapped interfaces. Be sure to include the parentheses in your command. In routed mode, if you do not specify the real and mapped interfaces, all interfaces are used; you can also specify the keyword <b>any</b> for one or both of the interfaces.</li> <li>• <b>Mapped IP address</b>—Specify the mapped IP address as: <ul style="list-style-type: none"> <li>– An existing network object (see <a href="#">Step 1</a>).</li> <li>– An existing network object group (see <a href="#">Step 1</a>).</li> </ul> </li> <li>• <b>Interface PAT fallback</b>—(Optional) The <b>interface</b> keyword enables interface PAT fallback. After the mapped IP addresses are used up, then the IP address of the mapped interface is used. For this option, you must configure a specific interface for the <i>mapped_ifc</i>. (You cannot specify <b>interface</b> in transparent mode).</li> <li>• <b>DNS</b>—(Optional) The <b>dns</b> keyword translates DNS replies. Be sure DNS inspection is enabled (it is enabled by default). See the <a href="#">“DNS and NAT” section on page 29-24</a> for more information.</li> </ul> |

## Examples

The following example configures dynamic NAT that hides 192.168.2.0 network behind a range of outside addresses 10.2.2.1 through 10.2.2.10:

```
hostname(config)# object network my-range-obj
hostname(config-network-object)# range 10.2.2.1 10.2.2.10
hostname(config)# object network my-inside-net
hostname(config-network-object)# subnet 192.168.2.0 255.255.255.0
hostname(config-network-object)# nat (inside,outside) dynamic my-range-obj
```

The following example configures dynamic NAT with dynamic PAT backup. Hosts on inside network 10.76.11.0 are mapped first to the nat-range1 pool (10.10.10.10-10.10.10.20). After all addresses in the nat-range1 pool are allocated, dynamic PAT is performed using the pat-ip1 address (10.10.10.21). In the unlikely event that the PAT translations are also use up, dynamic PAT is performed using the outside interface address.

```
hostname(config)# object network nat-range1
hostname(config-network-object)# range 10.10.10.10 10.10.10.20

hostname(config-network-object)# object network pat-ip1
hostname(config-network-object)# host 10.10.10.21

hostname(config-network-object)# object-group network nat-pat-grp
hostname(config-network-object)# network-object object nat-range1
hostname(config-network-object)# network-object object pat-ip1

hostname(config-network-object)# object network my_net_obj5
hostname(config-network-object)# subnet 10.76.11.0 255.255.255.0
hostname(config-network-object)# nat (inside,outside) dynamic nat-pat-grp interface
```

## Configuring Dynamic PAT (Hide)

This section describes how to configure network object NAT for dynamic PAT (hide). For more information, see the [“Dynamic PAT” section on page 29-10](#).

### Guidelines

For a PAT pool:

- If available, the real source port number is used for the mapped port. However, if the real port is *not* available, by default the mapped ports are chosen from the same range of ports as the real port number: 0 to 511, 512 to 1023, and 1024 to 65535. Therefore, ports below 1024 have only a small PAT pool that can be used. (8.4(3) and later, not including 8.5(1)) If you have a lot of traffic that uses the lower port ranges, you can now specify a flat range of ports to be used instead of the three unequal-sized tiers: either 1024 to 65535, or 1 to 65535.
- (8.4(3) and later, not including 8.5(1)) If you use the same PAT pool object in two separate rules, then be sure to specify the same options for each rule. For example, if one rule specifies extended PAT and a flat range, then the other rule must also specify extended PAT and a flat range.

For extended PAT for a PAT pool (8.4(3) and later, not including 8.5(1)):

- Many application inspections do not support extended PAT. See the [“Default Settings” section on page 42-4 in Chapter 42, “Getting Started with Application Layer Protocol Inspection,”](#) for a complete list of unsupported inspections.
- If you enable extended PAT for a dynamic PAT rule, then you cannot also use an address in the PAT pool as the PAT address in a separate static NAT-with-port-translation rule. For example, if the PAT pool includes 10.1.1.1, then you cannot create a static NAT-with-port-translation rule using 10.1.1.1 as the PAT address.
- If you use a PAT pool and specify an interface for fallback, you cannot specify extended PAT.
- For VoIP deployments that use ICE or TURN, do not use extended PAT. ICE and TURN rely on the PAT binding to be the same for all destinations.

For round robin for a PAT pool:

- (8.4(3) and later, not including 8.5(1)) If a host has an existing connection, then subsequent connections from that host will use the same PAT IP address if ports are available. **Note:** This “stickiness” does not survive a failover. If the ASA fails over, then subsequent connections from a host may not use the initial IP address.
- (8.4(2), 8.5(1)) If a host has an existing connection, then subsequent connections from that host will likely use *different* PAT addresses for each connection because of the round robin allocation. In this case, you may have problems when accessing two websites that exchange information about the host, for example an e-commerce site and a payment site. When these sites see two different IP addresses for what is supposed to be a single host, the transaction may fail.
- Round robin, especially when combined with extended PAT, can consume a large amount of memory. Because NAT pools are created for every mapped protocol/IP address/port range, round robin results in a large number of concurrent NAT pools, which use memory. Extended PAT results in an even larger number of concurrent NAT pools.

## Detailed Steps

|        | Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p>(Optional)</p> <p>Network object:</p> <pre>object network obj_name   {host ip_address   range ip_address_1   ip_address_2}</pre> <p>Network object group:</p> <pre>object-group network grp_name   {network-object {object net_obj_name     host ip_address}     group-object grp_obj_name}</pre> <p>Example:</p> <pre>hostname(config)# object network PAT_POOL1 hostname(config-network-object)# range 10.5.1.80 10.7.1.80  hostname(config)# object network PAT_POOL2 hostname(config-network-object)# range 10.9.1.1 10.10.1.1  hostname(config)# object network PAT_IP hostname(config-network-object)# host 10.5.1.79  hostname(config-network-object)# object-group network PAT_POOLS hostname(config-network)# network-object object PAT_POOL1 hostname(config-network)# network-object object PAT_POOL2 hostname(config-network)# network-object object PAT_IP</pre> | <p>Specify the <b>mapped</b> address(es) (that you want to translate to). You can configure a single address or, for a PAT pool, multiple addresses. Configure a network object or network object group. A network object group can contain objects and/or inline addresses. Alternatively, you can skip this step if you want to enter a single IP address as an inline value for the <b>nat</b> command or if you want to use the interface address by specifying the <b>interface</b> keyword.</p> <p>For mapped addresses used as a PAT pool, all addresses in the object or group, including ranges, are used as PAT addresses.</p> <p><b>Note</b> The object or group cannot contain a subnet.</p> <p>See the “<a href="#">Guidelines and Limitations</a>” section on page 30-2 for information about disallowed mapped IP addresses.</p> <p>For more information about configuring a network object or group, see the “<a href="#">Configuring Objects</a>” section on page 13-3.</p> |
| Step 2 | <pre>object network obj_name</pre> <p><b>Example:</b></p> <pre>hostname(config)# object network my-host-obj1</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Configures a network object for which you want to configure NAT, or enters object network configuration mode for an existing network object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 3 | <pre>{host ip_address   subnet subnet_address netmask   range ip_address_1 ip_address_2}</pre> <p><b>Example:</b></p> <pre>hostname(config-network-object)# range 10.1.1.1 10.1.1.90</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>If you are creating a new network object, defines the <b>real</b> IP address(es) that you want to translate.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Command                                                                                                                                                                                                                                                                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <p><b>Step 4</b></p> <pre> <b>nat</b> [(<i>real_ifc</i>,<i>mapped_ifc</i>)] <b>dynamic</b> {<i>mapped_inline_host_ip</i>   <i>mapped_obj</i>   <b>pat-pool</b> <i>mapped_obj</i> [<b>round-robin</b>] [<b>extended</b>] [<b>flat</b> [<b>include-reserve</b>]]   <b>interface</b>} [<b>interface</b>] [<b>dns</b>] </pre> <p><b>Example:</b></p> <pre> hostname(config-network-object)# nat (any,outside) dynamic interface </pre> | <p>Configures <b>dynamic PAT</b> for the object IP addresses. You can only define a single NAT rule for a given object. See the <a href="#">“Additional Guidelines” section on page 30-2</a>.</p> <p>See the following guidelines:</p> <ul style="list-style-type: none"> <li>• <b>Interfaces</b>—(Required for transparent mode) Specify the real and mapped interfaces. Be sure to include the parentheses in your command. In routed mode, if you do not specify the real and mapped interfaces, all interfaces are used; you can also specify the keyword <b>any</b> for one or both of the interfaces.</li> <li>• <b>Mapped IP address</b>—You can specify the mapped IP address as: <ul style="list-style-type: none"> <li>– An inline host address.</li> <li>– An existing network object that is defined as a host address (see <a href="#">Step 1</a>).</li> <li>– <b>pat-pool</b>—An existing network object or group that contains multiple addresses.</li> <li>– <b>interface</b>—(Routed mode only) The IP address of the mapped interface is used as the mapped address. For this option, you must configure a specific interface for the <i>mapped_ifc</i>. You must use this keyword when you want to use the interface IP address; you cannot enter it inline or as an object.</li> </ul> </li> <li>• For a PAT pool, you can specify one or more of the following options: <ul style="list-style-type: none"> <li>– <b>Round robin</b>—The <b>round-robin</b> keyword enables round-robin address allocation for a PAT pool. Without round robin, by default all ports for a PAT address will be allocated before the next PAT address is used. The round-robin method assigns an address/port from each PAT address in the pool before returning to use the first address again, and then the second address, and so on.</li> </ul> </li> </ul> <p>(continued)</p> |

| Command | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | <p>(continued)</p> <ul style="list-style-type: none"> <li>Extended PAT—(8.4(3) and later, not including 8.5(1)) The <b>extended</b> keyword enables extended PAT. Extended PAT uses 65535 ports per <i>service</i>, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80.</li> <li>Flat range—(8.4(3) and later, not including 8.5(1)) The <b>flat</b> keyword enables use of the entire 1024 to 65535 port range when allocating ports. When choosing the mapped port number for a translation, the ASA uses the real source port number if it is available. However, without this option, if the real port is <i>not</i> available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also specify the <b>include-reserve</b> keyword.</li> <li>Interface PAT fallback—(Optional) The <b>interface</b> keyword enables interface PAT fallback when entered after a primary PAT address. After the primary PAT address(es) are used up, then the IP address of the mapped interface is used. For this option, you must configure a specific interface for the <i>mapped_ifc</i>. (You cannot specify <b>interface</b> in transparent mode).</li> <li>DNS—(Optional) The <b>dns</b> keyword translates DNS replies. Be sure DNS inspection is enabled (it is enabled by default). See the “DNS and NAT” section on page 29-24 for more information.</li> </ul> |

## Examples

The following example configures dynamic PAT that hides the 192.168.2.0 network behind address 10.2.2.2:

```
hostname(config)# object network my-inside-net
hostname(config-network-object)# subnet 192.168.2.0 255.255.255.0
hostname(config-network-object)# nat (inside,outside) dynamic 10.2.2.2
```

The following example configures dynamic PAT that hides the 192.168.2.0 network behind the outside interface address:

```
hostname(config)# object network my-inside-net
hostname(config-network-object)# subnet 192.168.2.0 255.255.255.0
hostname(config-network-object)# nat (inside,outside) dynamic interface
```

## Configuring Static NAT or Static NAT-with-Port-Translation

This section describes how to configure a static NAT rule using network object NAT. For more information, see the [“Static NAT” section on page 29-3](#).

### Detailed Steps

|        | Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p>(Optional)</p> <p>Network object:</p> <pre>object network obj_name   {host ip_address      subnet subnet_address netmask      range ip_address_1 ip_address_2}</pre> <p>Network object group:</p> <pre>object-group network grp_name   {network-object {object net_obj_name      subnet_address netmask      host ip_address}      group-object grp_obj_name}</pre> <p><b>Example:</b></p> <pre>hostname(config)# object network MAPPED_IPS hostname(config-network-object)# subnet 10.1.1.0 255.255.255.0</pre> | <p>To specify the <b>mapped</b> addresses (that you want to translate to), configure a network object or network object group. A network object group can contain objects and/or inline addresses. Alternatively, you can skip this step if you want to enter the IP addresses as an inline value for the <b>nat</b> command or if you want to use the interface address (for static NAT-with-port-translation) by specifying the <b>interface</b> keyword.</p> <p>See the <a href="#">“Guidelines and Limitations” section on page 30-2</a> for information about disallowed mapped IP addresses.</p> <p>For more information about configuring a network object or group, see the <a href="#">“Configuring Objects” section on page 13-3</a>.</p> |
| Step 2 | <pre>object network obj_name</pre> <p><b>Example:</b></p> <pre>hostname(config)# object network my-host-obj1</pre>                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Configures a network object for which you want to configure NAT, or enters object network configuration mode for an existing network object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 3 | <pre>{host ip_address   subnet subnet_address netmask   range ip_address_1 ip_address_2}</pre> <p><b>Example:</b></p> <pre>hostname(config-network-object)# subnet 10.2.1.0 255.255.255.0</pre>                                                                                                                                                                                                                                                                                                                     | <p>If you are creating a new network object, defines the <b>real</b> IP address(es) that you want to translate.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Command                                                                                                                                                                                                                                                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Step 4</b></p> <pre> <b>nat</b> [(<i>real_ifc</i>,<i>mapped_ifc</i>)] <b>static</b> {<i>mapped_inline_ip</i>   <i>mapped_obj</i>   <b>interface</b>} [<b>dns</b>   <b>service</b> {<b>tcp</b>   <b>udp</b>} <i>real_port mapped_port</i>] [<b>no-proxy-arp</b>] </pre> <p><b>Example:</b></p> <pre> hostname(config-network-object)# nat (inside,outside) static MAPPED_IPS service tcp 80 8080 </pre> | <p>Configures <b>static NAT</b> for the object IP addresses.</p> <p><b>Note</b> You can only define a single NAT rule for a given object. See the <a href="#">“Additional Guidelines” section on page 30-2</a>.</p> <p>See the following guidelines:</p> <ul style="list-style-type: none"> <li>• <b>Interfaces</b>—(Required for transparent mode) Specify the real and mapped interfaces. Be sure to include the parentheses in your command. In routed mode, if you do not specify the real and mapped interfaces, all interfaces are used; you can also specify the keyword <b>any</b> for one or both of the interfaces.</li> <li>• <b>Mapped IP Addresses</b>—You can specify the mapped IP address as: <ul style="list-style-type: none"> <li>– An inline IP address. The netmask or range for the mapped network is the same as that of the real network. For example, if the real network is a host, then this address will be a host address. In the case of a range, then the mapped addresses include the same number of addresses as the real range. For example, if the real address is defined as a range from 10.1.1.1 through 10.1.1.6, and you specify 172.20.1.1 as the mapped address, then the mapped range will include 172.20.1.1 through 172.20.1.6.</li> <li>– An existing network object or group (see <a href="#">Step 1</a>).</li> <li>– <b>interface</b>—(Static NAT-with-port-translation only; routed mode) For this option, you must configure a specific interface for the <i>mapped_ifc</i>. Be sure to also configure the <b>service</b> keyword.</li> </ul> <p>Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses. For more information, see the <a href="#">“Static NAT” section on page 29-3</a>.</p> </li> <li>• <b>DNS</b>—(Optional) The <b>dns</b> keyword translates DNS replies. Be sure DNS inspection is enabled (it is enabled by default). See the <a href="#">“DNS and NAT” section on page 29-24</a> for more information. This option is not available if you specify the <b>service</b> keyword.</li> <li>• <b>Port translation</b>—(Static NAT-with-port-translation only) Specify <b>tcp</b> or <b>udp</b> and the real and mapped ports. You can enter either a port number or a well-known port name (such as <b>ftp</b>).</li> <li>• <b>No Proxy ARP</b>—(Optional) Specify <b>no-proxy-arp</b> to disable proxy ARP for incoming packets to the mapped IP addresses. See the <a href="#">“Mapped Addresses and Routing” section on page 29-22</a> for more information.</li> </ul> |

### Examples

The following example configures static NAT for the real host 10.1.1.1 on the inside to 10.2.2.2 on the outside with DNS rewrite enabled.

```
hostname(config)# object network my-host-obj1
hostname(config-network-object)# host 10.1.1.1
hostname(config-network-object)# nat (inside,outside) static 10.2.2.2 dns
```

The following example configures static NAT for the real host 10.1.1.1 on the inside to 2.2.2.2 on the outside using a mapped object.

```
hostname(config)# object network my-mapped-obj
hostname(config-network-object)# host 10.2.2.2

hostname(config-network-object)# object network my-host-obj1
hostname(config-network-object)# host 10.1.1.1
hostname(config-network-object)# nat (inside,outside) static my-mapped-obj
```

The following example configures static NAT-with-port-translation for 10.1.1.1 at TCP port 21 to the outside interface at port 2121.

```
hostname(config)# object network my-ftp-server
hostname(config-network-object)# host 10.1.1.1
hostname(config-network-object)# nat (inside,outside) static interface service tcp 21 2121
```

## Configuring Identity NAT

This section describes how to configure an identity NAT rule using network object NAT. For more information, see the [“Identity NAT” section on page 29-11](#).

### Detailed Steps

|        | Command                                                                                                                                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | (Optional)<br><br><pre>object network obj_name {host ip_address    subnet subnet_address netmask    range ip_address_1 ip_address_2}</pre><br><b>Example:</b><br><pre>hostname(config)# object network MAPPED_IPS hostname(config-network-object)# subnet 10.1.1.0 255.255.255.0</pre> | For the <b>mapped</b> addresses (which will be the same as the real addresses), configure a network object. Alternatively, you can skip this step if you want to enter the IP addresses as an inline value for the <b>nat</b> command.<br><br>For more information about configuring a network object, see the <a href="#">“Configuring Objects” section on page 13-3</a> . |
| Step 2 | <pre>object network obj_name</pre><br><b>Example:</b><br><pre>hostname(config)# object network my-host-obj1</pre>                                                                                                                                                                      | Configures a network object for which you want to perform identity NAT, or enters object network configuration mode for an existing network object.                                                                                                                                                                                                                         |

|        | Command                                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Step 3 | <pre>{host ip_address   subnet subnet_address netmask   range ip_address_1 ip_address_2}</pre> <p><b>Example:</b></p> <pre>hostname(config-network-object)# subnet 10.1.1.0 255.255.255.0</pre>                       | <p>If you are creating a new network object, defines the real IP address(es) to which you want to perform identity NAT. If you configured a network object for the mapped addresses in <a href="#">Step 1</a>, then these addresses must match.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Step 4 | <pre>nat [(real_ifc,mapped_ifc)] static {mapped_inline_ip   mapped_obj} [no-proxy-arp] [route-lookup]</pre> <p><b>Example:</b></p> <pre>hostname(config-network-object)# nat (inside,outside) static MAPPED_IPS</pre> | <p>Configures <b>identity</b> NAT for the object IP addresses.</p> <p><b>Note</b> You can only define a single NAT rule for a given object. See the <a href="#">“Additional Guidelines”</a> section on page 30-2.</p> <p>See the following guidelines:</p> <ul style="list-style-type: none"> <li>• <b>Interfaces</b>—(Required for transparent mode) Specify the real and mapped interfaces. Be sure to include the parentheses in your command. In routed mode, if you do not specify the real and mapped interfaces, all interfaces are used; you can also specify the keyword <b>any</b> for one or both of the interfaces.</li> <li>• <b>Mapped IP addresses</b>—Be sure to configure the same IP address for both the mapped and real address. Use one of the following: <ul style="list-style-type: none"> <li>– <b>Network object</b>—Including the same IP address as the real object (see <a href="#">Step 1</a>).</li> <li>– <b>Inline IP address</b>—The netmask or range for the mapped network is the same as that of the real network. For example, if the real network is a host, then this address will be a host address. In the case of a range, then the mapped addresses include the same number of addresses as the real range. For example, if the real address is defined as a range from 10.1.1.1 through 10.1.1.6, and you specify 10.1.1.1 as the mapped address, then the mapped range will include 10.1.1.1 through 10.1.1.6.</li> </ul> </li> <li>• <b>No Proxy ARP</b>—Specify <b>no-proxy-arp</b> to disable proxy ARP for incoming packets to the mapped IP addresses. See the <a href="#">“Mapped Addresses and Routing”</a> section on page 29-22 for more information.</li> <li>• <b>Route lookup</b>—(Routed mode only; interface(s) specified) Specify <b>route-lookup</b> to determine the egress interface using a route lookup instead of using the interface specified in the NAT command. See the <a href="#">“Determining the Egress Interface”</a> section on page 29-24 for more information.</li> </ul> |

## Example

The following example maps a host address to itself using an inline mapped address:

```
hostname(config)# object network my-host-obj1
hostname(config-network-object)# host 10.1.1.1
hostname(config-network-object)# nat (inside,outside) static 10.1.1.1
```

The following example maps a host address to itself using a network object:

```
hostname(config)# object network my-host-obj1-identity
hostname(config-network-object)# host 10.1.1.1

hostname(config-network-object)# object network my-host-obj1
hostname(config-network-object)# host 10.1.1.1
hostname(config-network-object)# nat (inside,outside) static my-host-obj1-identity
```

# Monitoring Network Object NAT

To monitor object NAT, enter one of the following commands:

| Command                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <code>show nat</code>                | Shows NAT statistics, including hits for each NAT rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>show nat pool</code>           | Shows NAT pool statistics, including the addresses and ports allocated, and how many times they were allocated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>show running-config nat</code> | <p>Shows the NAT configuration.</p> <p><b>Note</b> You cannot view the NAT configuration using the <b>show running-config object</b> command. You cannot reference objects or object groups that have not yet been created in <b>nat</b> commands. To avoid forward or circular references in <b>show</b> command output, the <b>show running-config</b> command shows the <b>object</b> command two times: first, where the IP address(es) are defined; and later, where the <b>nat</b> command is defined. This command output guarantees that objects are defined first, then object groups, and finally NAT. For example:</p> <pre>hostname# show running-config ... object network obj1   range 192.168.49.1 192.150.49.100 object network obj2   object 192.168.49.100 object network network-1   subnet &lt;network-1&gt; object network network-2   subnet &lt;network-2&gt; object-group network pool   network-object object obj1   network-object object obj2 ... object network network-1   nat (inside,outside) dynamic pool object network network-2   nat (inside,outside) dynamic pool</pre> |
| <code>show xlate</code>              | Shows current NAT session information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

# Configuration Examples for Network Object NAT

This section includes the following configuration examples:

- [Providing Access to an Inside Web Server \(Static NAT\)](#), page 30-15
- [NAT for Inside Hosts \(Dynamic NAT\) and NAT for an Outside Web Server \(Static NAT\)](#), page 30-16
- [Inside Load Balancer with Multiple Mapped Addresses \(Static NAT, One-to-Many\)](#), page 30-17
- [Single Address for FTP, HTTP, and SMTP \(Static NAT-with-Port-Translation\)](#), page 30-18
- [DNS Server on Mapped Interface, Web Server on Real Interface \(Static NAT with DNS Modification\)](#), page 30-19
- [DNS Server and Web Server on Mapped Interface, Web Server is Translated \(Static NAT with DNS Modification\)](#), page 30-21

## Providing Access to an Inside Web Server (Static NAT)

The following example performs static NAT for an inside web server. The real address is on a private network, so a public address is required. Static NAT is necessary so hosts can initiate traffic to the web server at a fixed address. (See [Figure 30-1](#)).

**Figure 30-1** Static NAT for an Inside Web Server

**Step 1** Create a network object for the internal web server:

```
hostname(config)# object network myWebServ
```

**Step 2** Define the web server address:

```
hostname(config-network-object)# host 10.1.2.27
```

**Step 3** Configure static NAT for the object:

```
hostname(config-network-object)# nat (inside,outside) static 209.165.201.10
```

## NAT for Inside Hosts (Dynamic NAT) and NAT for an Outside Web Server (Static NAT)

The following example configures dynamic NAT for inside users on a private network when they access the outside. Also, when inside users connect to an outside web server, that web server address is translated to an address that appears to be on the inside network. (See [Figure 30-2](#)).

**Figure 30-2** Dynamic NAT for Inside, Static NAT for Outside Web Server

248773

**Step 1** Create a network object for the dynamic NAT pool to which you want to translate the inside addresses:

```
hostname(config)# object network myNatPool
hostname(config-network-object)# range 209.165.201.20 209.165.201.30
```

**Step 2** Create a network object for the inside network:

```
hostname(config)# object network myInsNet
hostname(config-network-object)# subnet 10.1.2.0 255.255.255.0
```

**Step 3** Enable dynamic NAT for the inside network:

```
hostname(config-network-object)# nat (inside,outside) dynamic myNatPool
```

**Step 4** Create a network object for the outside web server:

```
hostname(config)# object network myWebServ
```

**Step 5** Define the web server address:

```
hostname(config-network-object)# host 209.165.201.12
```

**Step 6** Configure static NAT for the web server:

```
hostname(config-network-object)# nat (outside,inside) static 10.1.2.20
```

## Inside Load Balancer with Multiple Mapped Addresses (Static NAT, One-to-Many)

The following example shows an inside load balancer that is translated to multiple IP addresses. When an outside host accesses one of the mapped IP addresses, it is untranslated to the single load balancer address. Depending on the URL requested, it redirects traffic to the correct web server. (See [Figure 30-3](#)).

**Figure 30-3** Static NAT with One-to-Many for an Inside Load Balancer

248633

**Step 1** Create a network object for the addresses to which you want to map the load balancer:

```
hostname(config)# object network myPublicIPs
hostname(config-network-object)# range 209.165.201.3 209.265.201.8
```

**Step 2** Create a network object for the load balancer:

```
hostname(config)# object network myLBHost
```

**Step 3** Define the load balancer address:

```
hostname(config-network-object)# host 10.1.2.27
```

**Step 4** Configure static NAT for the load balancer:

```
hostname(config-network-object)# nat (inside,outside) static myPublicIPs
```

## Single Address for FTP, HTTP, and SMTP (Static NAT-with-Port-Translation)

The following static NAT-with-port-translation example provides a single address for remote users to access FTP, HTTP, and SMTP. These servers are actually different devices on the real network, but for each server, you can specify static NAT-with-port-translation rules that use the same mapped IP address, but different ports. (See [Figure 30-4](#).)

**Figure 30-4** Static NAT-with-Port-Translation

**Step 1** Create a network object for the FTP server address:

```
hostname(config)# object network FTP_SERVER
```

- Step 2** Define the FTP server address, and configure static NAT with identity port translation for the FTP server:

```
hostname(config-network-object)# host 10.1.2.27
hostname(config-network-object)# nat (inside,outside) static 209.165.201.3 service tcp ftp
ftp
```

- Step 3** Create a network object for the HTTP server address:

```
hostname(config)# object network HTTP_SERVER
```

- Step 4** Define the HTTP server address, and configure static NAT with identity port translation for the HTTP server:

```
hostname(config-network-object)# host 10.1.2.28
hostname(config-network-object)# nat (inside,outside) static 209.165.201.3 service tcp
http http
```

- Step 5** Create a network object for the SMTP server address:

```
hostname(config)# object network SMTP_SERVER
```

- Step 6** Define the SMTP server address, and configure static NAT with identity port translation for the SMTP server:

```
hostname(config-network-object)# host 10.1.2.29
hostname(config-network-object)# nat (inside,outside) static 209.165.201.3 service tcp
smtp smtp
```

---

## DNS Server on Mapped Interface, Web Server on Real Interface (Static NAT with DNS Modification)

For example, a DNS server is accessible from the outside interface. A server, ftp.cisco.com, is on the inside interface. You configure the ASA to statically translate the ftp.cisco.com real address (10.1.3.14) to a mapped address (209.165.201.10) that is visible on the outside network. (See [Figure 30-5](#).) In this case, you want to enable DNS reply modification on this static rule so that inside users who have access to ftp.cisco.com using the real address receive the real address from the DNS server, and not the mapped address.

When an inside host sends a DNS request for the address of ftp.cisco.com, the DNS server replies with the mapped address (209.165.201.10). The ASA refers to the static rule for the inside server and translates the address inside the DNS reply to 10.1.3.14. If you do not enable DNS reply modification, then the inside host attempts to send traffic to 209.165.201.10 instead of accessing ftp.cisco.com directly.

**Figure 30-5** DNS Reply Modification

130021

**Step 1** Create a network object for the FTP server address:

```
hostname(config)# object network FTP_SERVER
```

**Step 2** Define the FTP server address, and configure static NAT with DNS modification:

```
hostname(config-network-object)# host 10.1.3.14
hostname(config-network-object)# nat (inside,outside) static 209.165.201.10 dns
```

## DNS Server and Web Server on Mapped Interface, Web Server is Translated (Static NAT with DNS Modification)

Figure 30-6 shows a web server and DNS server on the outside. The ASA has a static translation for the outside server. In this case, when an inside user requests the address for ftp.cisco.com from the DNS server, the DNS server responds with the real address, 209.165.201.10. Because you want inside users to use the mapped address for ftp.cisco.com (10.1.2.56) you need to configure DNS reply modification for the static translation.

**Figure 30-6** DNS Reply Modification Using Outside NAT

**Step 1** Create a network object for the FTP server address:

```
hostname(config)# object network FTP_SERVER
```

**Step 2** Define the FTP server address, and configure static NAT with DNS modification:

```
hostname(config-network-object)# host 209.165.201.10
hostname(config-network-object)# nat (outside,inside) static 10.1.2.56 dns
```

# Feature History for Network Object NAT

Table 30-1 lists each feature change and the platform release in which it was implemented.

**Table 30-1** Feature History for Network Object NAT

| Feature Name                                                                | Platform Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------------------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Network Object NAT                                                          | 8.3(1)            | Configures NAT for a network object IP address(es).<br><br>We introduced or modified the following commands: <b>nat</b> (object network configuration mode), <b>show nat</b> , <b>show xlate</b> , <b>show nat pool</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Identity NAT configurable proxy ARP and route lookup                        | 8.4(2)            | In earlier releases for identity NAT, proxy ARP was disabled, and a route lookup was always used to determine the egress interface. You could not configure these settings. In 8.4(2) and later, the default behavior for identity NAT was changed to match the behavior of other static NAT configurations: proxy ARP is enabled, and the NAT configuration determines the egress interface (if specified) by default. You can leave these settings as is, or you can enable or disable them discretely. Note that you can now also disable proxy ARP for regular static NAT.<br><br>When upgrading to 8.4(2) from 8.3(1), 8.3(2), and 8.4(1), all identity NAT configurations will now include the <b>no-proxy-arp</b> and <b>route-lookup</b> keywords, to maintain existing functionality.<br><br>We modified the following commands: <b>nat static</b> [ <b>no-proxy-arp</b> ] [ <b>route-lookup</b> ]. |
| PAT pool and round robin address assignment                                 | 8.4(2)            | You can now specify a pool of PAT addresses instead of a single address. You can also optionally enable round-robin assignment of PAT addresses instead of first using all ports on a PAT address before using the next address in the pool. These features help prevent a large number of connections from a single PAT address from appearing to be part of a DoS attack and makes configuration of large numbers of PAT addresses easy.<br><br>We modified the following commands: <b>nat dynamic</b> [ <b>pat-pool mapped_object</b> ] [ <b>round-robin</b> ].                                                                                                                                                                                                                                                                                                                                           |
| Round robin PAT pool allocation uses the same IP address for existing hosts | 8.4(3)            | When using a PAT pool with round robin allocation, if a host has an existing connection, then subsequent connections from that host will use the same PAT IP address if ports are available.<br><br>We did not modify any commands.<br><br><i>This feature is not available in 8.5(1).</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Table 30-1** Feature History for Network Object NAT (continued)

| Feature Name                           | Platform Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flat range of PAT ports for a PAT pool | 8.4(3)            | <p>If available, the real source port number is used for the mapped port. However, if the real port is <i>not</i> available, by default the mapped ports are chosen from the same range of ports as the real port number: 0 to 511, 512 to 1023, and 1024 to 65535. Therefore, ports below 1024 have only a small PAT pool.</p> <p>If you have a lot of traffic that uses the lower port ranges, when using a PAT pool, you can now specify a flat range of ports to be used instead of the three unequal-sized tiers: either 1024 to 65535, or 1 to 65535.</p> <p>We modified the following commands: <b>nat dynamic [pat-pool mapped_object [flat [include-reserve]]]</b>.</p> <p><i>This feature is not available in 8.5(1).</i></p> |

Table 30-1 Feature History for Network Object NAT (continued)

| Feature Name                                                                                      | Platform Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Extended PAT for a PAT pool                                                                       | 8.4(3)            | <p>Each PAT IP address allows up to 65535 ports. If 65535 ports do not provide enough translations, you can now enable extended PAT for a PAT pool. Extended PAT uses 65535 ports per <i>service</i>, as opposed to per IP address, by including the destination address and port in the translation information.</p> <p>We modified the following commands: <b>nat dynamic [pat-pool mapped_object [extended]]</b>.</p> <p><i>This feature is not available in 8.5(1).</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Automatic NAT rules to translate a VPN peer's local IP address back to the peer's real IP address | 8.4(3)            | <p>In rare situations, you might want to use a VPN peer's real IP address on the inside network instead of an assigned local IP address. Normally with VPN, the peer is given an assigned local IP address to access the inside network. However, you might want to translate the local IP address back to the peer's real public IP address if, for example, your inside servers and network security is based on the peer's real IP address.</p> <p>You can enable this feature on one interface per tunnel group. Object NAT rules are dynamically added and deleted when the VPN session is established or disconnected. You can view the rules using the <b>show nat</b> command.</p> <p><b>Note</b> Because of routing issues, we do not recommend using this feature unless you know you need this feature; contact Cisco TAC to confirm feature compatibility with your network. See the following limitations:</p> <ul style="list-style-type: none"> <li>• Only supports Cisco IPsec and AnyConnect Client.</li> <li>• Return traffic to the public IP addresses must be routed back to the ASA so the NAT policy and VPN policy can be applied.</li> <li>• Does not support load-balancing (because of routing issues).</li> <li>• Does not support roaming (public IP changing).</li> </ul> <p>We introduced the following command:<br/> <b>nat-assigned-to-public-ip interface</b> (tunnel-group general-attributes configuration mode).</p> |

# CHAPTER 31

## Configuring Twice NAT

---

Twice NAT lets you identify both the source and destination address in a single rule. This chapter shows you how to configure twice NAT and includes the following sections:

- [Information About Twice NAT, page 31-1](#)
- [Licensing Requirements for Twice NAT, page 31-2](#)
- [Prerequisites for Twice NAT, page 31-2](#)
- [Guidelines and Limitations, page 31-2](#)
- [Default Settings, page 31-3](#)
- [Configuring Twice NAT, page 31-3](#)
- [Monitoring Twice NAT, page 31-24](#)
- [Configuration Examples for Twice NAT, page 31-24](#)
- [Feature History for Twice NAT, page 31-28](#)

**Note**

---

For detailed information about how NAT works, see [Chapter 29, “Information About NAT.”](#)

---

## Information About Twice NAT

Twice NAT lets you identify both the source and destination address in a single rule. Specifying both the source and destination addresses lets you specify that a source address should be translated to A when going to destination X, but be translated to B when going to destination Y, for example.

**Note**

---

For static NAT, the rule is bidirectional, so be aware that “source” and “destination” are used in commands and descriptions throughout this guide even though a given connection might originate at the “destination” address. For example, if you configure static NAT with port address translation, and specify the source address as a Telnet server, and you want all traffic going to that Telnet server to have the port translated from 2323 to 23, then in the command, you must specify the *source* ports to be translated (real: 23, mapped: 2323). You specify the source ports because you specified the Telnet server address as the source address.

---

The destination address is optional. If you specify the destination address, you can either map it to itself (identity NAT), or you can map it to a different address. The destination mapping is always a static mapping.

Twice NAT also lets you use service objects for static NAT-with-port-translation; network object NAT only accepts inline definition.

For detailed information about the differences between twice NAT and network object NAT, see the [“How NAT is Implemented” section on page 29-16](#).

Twice NAT rules are added to section 1 of the NAT rules table, or if specified, section 3. For more information about NAT ordering, see the [“NAT Rule Order” section on page 29-20](#).

## Licensing Requirements for Twice NAT

| Model      | License Requirement |
|------------|---------------------|
| All models | Base License.       |

## Prerequisites for Twice NAT

- For both the real and mapped addresses, configure network objects or network object groups (the **object network** or **object-group network** command). Network object groups are particularly useful for creating a mapped address pool with discontinuous IP address ranges or multiple hosts or subnets. To create a network object or group, see the [“Configuring Objects and Groups” section on page 13-1](#).
- For static NAT-with-port-translation, configure TCP or UDP service objects (the **object service** command). To create a service object, see the [“Configuring a Service Object” section on page 13-4](#).

For specific guidelines for objects and groups, see the configuration section for the NAT type you want to configure. See also the [“Guidelines and Limitations” section](#).

## Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

### Context Mode Guidelines

Supported in single and multiple context mode.

### Firewall Mode Guidelines

- Supported in routed and transparent firewall mode.
- In transparent mode, you must specify the real and mapped interfaces; you cannot use **any**.
- In transparent mode, you cannot configure interface PAT, because the transparent mode interfaces do not have IP addresses. You also cannot use the management IP address as a mapped address.

### IPv6 Guidelines

Does not support IPv6.

### Additional Guidelines

- If you change the NAT configuration, and you do not want to wait for existing translations to time out before the new NAT information is used, you can clear the translation table using the **clear xlate** command. However, clearing the translation table disconnects all current connections that use translations.

**Note** If you remove a dynamic NAT or PAT rule, and then add a new rule with mapped addresses that overlap the addresses in the removed rule, then the new rule will not be used until all connections associated with the removed rule time out or are cleared using the **clear xlate** command. This safeguard ensures that the same address is not assigned to multiple hosts.

- Objects and object groups used in NAT cannot be undefined; they must include IP addresses.
- You can use the same objects in multiple rules.
- The mapped IP address pool cannot include:
  - The mapped interface IP address. If you specify **any** interface for the rule, then all interface IP addresses are disallowed. For interface PAT (routed mode only), use the **interface** keyword instead of the IP address.
  - (Transparent mode) The management IP address.
  - (Dynamic NAT) The standby interface IP address when VPN is enabled.
  - Existing VPN pool addresses.

## Default Settings

- By default, the rule is added to the end of section 1 of the NAT table.
- (Routed mode) The default real and mapped interface is Any, which applies the rule to all interfaces.
- (8.3(1), 8.3(2), and 8.4(1)) The default behavior for identity NAT has proxy ARP disabled. You cannot configure this setting. (8.4(2) and later) The default behavior for identity NAT has proxy ARP enabled, matching other static NAT rules. You can disable proxy ARP if desired.
- If you specify an optional interface, then the ASA uses the NAT configuration to determine the egress interface. (8.3(1) through 8.4(1)) The only exception is for identity NAT, which always uses a route lookup, regardless of the NAT configuration. (8.4(2) and later) For identity NAT, the default behavior is to use the NAT configuration, but you have the option to always use a route lookup instead.

## Configuring Twice NAT

This section describes how to configure twice NAT. This section includes the following topics:

- [Configuring Dynamic NAT, page 31-4](#)
- [Configuring Dynamic PAT \(Hide\), page 31-8](#)
- [Configuring Static NAT or Static NAT-with-Port-Translation, page 31-15](#)
- [Configuring Identity NAT, page 31-20](#)

## Configuring Dynamic NAT

This section describes how to configure twice NAT for dynamic NAT. For more information, see the [“Dynamic NAT” section on page 29-8](#).

### Detailed Steps

|               | Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p>Network object:</p> <pre>object network obj_name   {host ip_address   subnet   subnet_address netmask   range   ip_address_1 ip_address_2}</pre> <p>Network object group:</p> <pre>object-group network grp_name   {network-object {object net_obj_name     subnet_address netmask     host ip_address}     group-object grp_obj_name}</pre> <p><b>Example:</b></p> <pre>hostname(config)# object network MyInsNet hostname(config-network-object)# subnet 10.1.1.0 255.255.255.0</pre> | <p>Configure the <b>real source</b> addresses.</p> <p>You can configure either a network object or a network object group. For more information, see the <a href="#">“Configuring Objects” section on page 13-3</a>.</p> <p>If you want to translate all traffic, you can skip this step and specify the <b>any</b> keyword instead of creating an object or group.</p>                                                                                                                                                                                                                                                                 |
| <b>Step 2</b> | <p>Network object:</p> <pre>object network obj_name   range ip_address_1 ip_address_2</pre> <p>Network object group:</p> <pre>object-group network grp_name   {network-object {object net_obj_name     host ip_address}     group-object grp_obj_name}</pre> <p><b>Example:</b></p> <pre>hostname(config)# object network NAT_POOL hostname(config-network-object)# range 209.165.201.10 209.165.201.20</pre>                                                                              | <p>Configure the <b>mapped source</b> addresses.</p> <p>You can configure either a network object or a network object group.</p> <p>For dynamic NAT, you typically configure a larger group of addresses to be mapped to a smaller group. If a mapped network object contains both ranges and host IP addresses, then the ranges are used for dynamic NAT, and then the host IP addresses are used as a PAT fallback.</p> <p><b>Note</b> The mapped object or group cannot contain a subnet.</p> <p>See the <a href="#">“Guidelines and Limitations” section on page 31-2</a> for information about disallowed mapped IP addresses.</p> |

|               | Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <p>(Optional)</p> <p>Network object:</p> <pre>object network obj_name   {host ip_address   subnet   subnet_address netmask   range   ip_address_1 ip_address_2}</pre> <p>Network object group:</p> <pre>object-group network grp_name   {network-object {object net_obj_name     subnet_address netmask     host ip_address}     group-object grp_obj_name}</pre> <p><b>Example:</b></p> <pre>hostname(config)# object network Server1 hostname(config-network-object)# host 209.165.201.8</pre>    | <p>Configure the <b>real destination</b> addresses.</p> <p>You can configure either a network object or a network object group.</p> <p>Although the main feature of twice NAT is the inclusion of the destination IP address, the destination address is optional. If you do specify the destination address, you can configure static translation for that address or just use identity NAT for it. You might want to configure twice NAT without a destination address to take advantage of some of the other qualities of twice NAT, including the use of network object groups for real addresses, or manually ordering of rules. For more information, see the <a href="#">“Main Differences Between Network Object NAT and Twice NAT”</a> section on page 29-16.</p>                                                                                                                                                                            |
| <b>Step 4</b> | <p>(Optional)</p> <p>Network object:</p> <pre>object network obj_name   {host ip_address   subnet   subnet_address netmask   range   ip_address_1 ip_address_2}</pre> <p>Network object group:</p> <pre>object-group network grp_name   {network-object {object net_obj_name     subnet_address netmask     host ip_address}     group-object grp_obj_name}</pre> <p><b>Example:</b></p> <pre>hostname(config)# object network Server1_mapped hostname(config-network-object)# host 10.1.1.67</pre> | <p>Configure the <b>mapped destination</b> addresses.</p> <p>The destination translation is always static. For identity NAT, you can skip this step and simply use the same object or group for both the real and mapped addresses.</p> <p>If you want to translate the destination address, you can configure either a network object or a network object group. The static mapping is typically one-to-one, so the real addresses have the same quantity as the mapped addresses. You can, however, have different quantities if desired. For more information, see the <a href="#">“Static NAT”</a> section on page 29-3.</p> <p>For static interface NAT with port translation (routed mode only), you can skip this step and specify the <b>interface</b> keyword instead of a network object/group for the mapped address. For more information, see the <a href="#">“Static Interface NAT with Port Translation”</a> section on page 29-5.</p> |

| Command                                                                                                                                                                                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Step 5</b> (Optional)</p> <pre>object service obj_name   service {tcp   udp} destination   operator port</pre> <p><b>Example:</b></p> <pre>hostname(config)# object service REAL_SVC hostname(config-service-object)# service tcp destination eq 80</pre> <pre>hostname(config)# object service MAPPED_SVC hostname(config-service-object)# service tcp destination eq 8080</pre> | <p>Configure service objects for:</p> <ul style="list-style-type: none"> <li>• <b>Destination real port</b></li> <li>• <b>Destination mapped port</b></li> </ul> <p>Dynamic NAT does not support port translation. However, because the <i>destination</i> translation is always static, you can perform port translation for the destination port. A service object can contain both a source and destination port, but only the destination port is used in this case. If you specify the source port, it will be ignored. NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports. The “not equal” (<b>neq</b>) operator is not supported.</p> |

|        | Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Configuring Dynamic PAT (Hide)

This section describes how to configure twice NAT for dynamic PAT (hide). For more information, see the “[Dynamic PAT](#)” section on page 29-10.

### Guidelines

For a PAT pool:

- If available, the real source port number is used for the mapped port. However, if the real port is *not* available, by default the mapped ports are chosen from the same range of ports as the real port number: 0 to 511, 512 to 1023, and 1024 to 65535. Therefore, ports below 1024 have only a small PAT pool that can be used. (8.4(3) and later, not including 8.5(1)) If you have a lot of traffic that uses the lower port ranges, you can now specify a flat range of ports to be used instead of the three unequal-sized tiers: either 1024 to 65535, or 1 to 65535.
- (8.4(3) and later, not including 8.5(1)) If you use the same PAT pool object in two separate rules, then be sure to specify the same options for each rule. For example, if one rule specifies extended PAT and a flat range, then the other rule must also specify extended PAT and a flat range.

For extended PAT for a PAT pool (8.4(3) and later, not including 8.5(1)):

- Many application inspections do not support extended PAT. See the “Default Settings” section on page 42-4 in Chapter 42, “Getting Started with Application Layer Protocol Inspection,” for a complete list of unsupported inspections.
- If you enable extended PAT for a dynamic PAT rule, then you cannot also use an address in the PAT pool as the PAT address in a separate static NAT-with-port-translation rule. For example, if the PAT pool includes 10.1.1.1, then you cannot create a static NAT-with-port-translation rule using 10.1.1.1 as the PAT address.
- If you use a PAT pool and specify an interface for fallback, you cannot specify extended PAT.
- For VoIP deployments that use ICE or TURN, do not use extended PAT. ICE and TURN rely on the PAT binding to be the same for all destinations.

For round robin for a PAT pool:

- (8.4(3) and later, not including 8.5(1)) If a host has an existing connection, then subsequent connections from that host will use the same PAT IP address if ports are available. **Note:** This “stickiness” does not survive a failover. If the ASA fails over, then subsequent connections from a host may not use the initial IP address.
- (8.4(2), 8.5(1)) If a host has an existing connection, then subsequent connections from that host will likely use *different* PAT addresses for each connection because of the round robin allocation. In this case, you may have problems when accessing two websites that exchange information about the host, for example an e-commerce site and a payment site. When these sites see two different IP addresses for what is supposed to be a single host, the transaction may fail.
- Round robin, especially when combined with extended PAT, can consume a large amount of memory. Because NAT pools are created for every mapped protocol/IP address/port range, round robin results in a large number of concurrent NAT pools, which use memory. Extended PAT results in an even larger number of concurrent NAT pools.

## Detailed Steps

|        | Command                                                                                                                                                                                                                                                                                                                                     | Purpose                                                                                                                                                                                           |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | Network object:<br><br><pre>object network obj_name   {host ip_address   subnet     subnet_address netmask   range     ip_address_1 ip_address_2}</pre>                                                                                                                                                                                     | Configure the <b>real source</b> addresses.<br><br>You can configure either a network object or a network object group. For more information, see the “Configuring Objects” section on page 13-3. |
|        | Network object group:<br><br><pre>object-group network grp_name   {network-object {object net_obj_name       subnet_address netmask       host ip_address}       group-object grp_obj_name}</pre><br><b>Example:</b><br><pre>hostname(config)# object network MyInsNet hostname(config-network-object)# subnet 10.1.1.0 255.255.255.0</pre> | If you want to translate all traffic, you can skip this step and specify the <b>any</b> keyword instead of creating an object or group.                                                           |

| Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Step 2</b> Network object:</p> <pre>object network obj_name   {host ip_address   range ip_address_1   ip_address_2}</pre> <p>Network object group:</p> <pre>object-group network grp_name   {network-object {object net_obj_name     host ip_address}     group-object grp_obj_name}</pre> <p>Example:</p> <pre>hostname(config)# object network PAT_POOL1 hostname(config-network-object)# range 10.5.1.80 10.7.1.80  hostname(config)# object network PAT_POOL2 hostname(config-network-object)# range 10.9.1.1 10.10.1.1  hostname(config)# object network PAT_IP hostname(config-network-object)# host 10.5.1.79  hostname(config-network-object)# object-group network PAT_POOLS hostname(config-network)# network-object object PAT_POOL1 hostname(config-network)# network-object object PAT_POOL2 hostname(config-network)# network-object object PAT_IP</pre> | <p>Specify the <b>mapped</b> address(es) (that you want to translate to). You can configure a single address or, for a PAT pool, multiple addresses. Configure a network object or network object group. A network object group can contain objects and/or inline addresses. Alternatively, you can skip this step if you want to enter a single IP address as an inline value for the <b>nat</b> command or if you want to use the interface address by specifying the <b>interface</b> keyword.</p> <p>For mapped addresses used as a PAT pool, all addresses in the object or group, including ranges, are used as PAT addresses.</p> <p><b>Note</b> The object or group cannot contain a subnet.</p> <p>See the <a href="#">“Guidelines and Limitations” section on page 31-2</a> for information about disallowed mapped IP addresses.</p> <p>For more information about configuring a network object or group, see the <a href="#">“Configuring Objects” section on page 13-3</a>.</p> |
| <p><b>Step 3</b> (Optional)</p> <p>Network object:</p> <pre>object network obj_name   {host ip_address   subnet   subnet_address netmask   range   ip_address_1 ip_address_2}</pre> <p>Network object group:</p> <pre>object-group network grp_name   {network-object {object net_obj_name     subnet_address netmask     host ip_address}     group-object grp_obj_name}</pre> <p>Example:</p> <pre>hostname(config)# object network Server1 hostname(config-network-object)# host 209.165.201.8</pre>                                                                                                                                                                                                                                                                                                                                                                      | <p>Configure the <b>real destination</b> addresses.</p> <p>You can configure either a network object or a network object group.</p> <p>Although the main feature of twice NAT is the inclusion of the destination IP address, the destination address is optional. If you do specify the destination address, you can configure static translation for that address or just use identity NAT for it. You might want to configure twice NAT without a destination address to take advantage of some of the other qualities of twice NAT, including the use of network object groups for real addresses, or manually ordering of rules. For more information, see the <a href="#">“Main Differences Between Network Object NAT and Twice NAT” section on page 29-16</a>.</p>                                                                                                                                                                                                                   |

|        | Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <p>(Optional)</p> <p>Network object:</p> <pre>object network obj_name   {host ip_address   subnet   subnet_address netmask   range   ip_address_1 ip_address_2}</pre> <p>Network object group:</p> <pre>object-group network grp_name   {network-object {object net_obj_name     subnet_address netmask     host ip_address}     group-object grp_obj_name}</pre> <p><b>Example:</b></p> <pre>hostname(config)# object network Server1_mapped hostname(config-network-object)# host 10.1.1.67</pre> | <p>Configure the <b>mapped destination</b> addresses.</p> <p>The destination translation is always static. For identity NAT, you can skip this step and simply use the same object or group for both the real and mapped addresses.</p> <p>If you want to translate the destination address, you can configure either a network object or a network object group. The static mapping is typically one-to-one, so the real addresses have the same quantity as the mapped addresses. You can, however, have different quantities if desired. For more information, see the <a href="#">“Static NAT” section on page 29-3</a>.</p> <p>For static interface NAT with port translation (routed mode only), you can skip this step and specify the <b>interface</b> keyword instead of a network object/group for the mapped address. For more information, see the <a href="#">“Static Interface NAT with Port Translation” section on page 29-5</a>.</p> |
| Step 5 | <p>(Optional)</p> <pre>object service obj_name   service {tcp   udp} destination   operator port</pre> <p><b>Example:</b></p> <pre>hostname(config)# object service REAL_SVC hostname(config-service-object)# service tcp destination eq 80</pre> <pre>hostname(config)# object service MAPPED_SVC hostname(config-service-object)# service tcp destination eq 8080</pre>                                                                                                                           | <p>Configure service objects for:</p> <ul style="list-style-type: none"> <li>• <b>Destination real port</b></li> <li>• <b>Destination mapped port</b></li> </ul> <p>Dynamic PAT does not support additional port translation. However, because the <i>destination</i> translation is always static, you can perform port translation for the destination port. A service object can contain both a source and destination port, but only the destination port is used in this case. If you specify the source port, it will be ignored. NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports. The “not equal” (<b>neq</b>) operator is not supported.</p>                                                                                               |

Step 6

| Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | <p>(continued)</p> <p>For a PAT pool, you can specify one or more of the following options:</p> <p>-- Round robin—The <b>round-robin</b> keyword enables round-robin address allocation for a PAT pool. Without round robin, by default all ports for a PAT address will be allocated before the next PAT address is used. The round-robin method assigns an address/port from each PAT address in the pool before returning to use the first address again, and then the second address, and so on.</p> <p>-- Extended PAT—(8.4(3) and later, not including 8.5(1)) The <b>extended</b> keyword enables extended PAT. Extended PAT uses 65535 ports per <i>service</i>, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80.</p> <p>-- Flat range—(8.4(3) and later, not including 8.5(1)) The <b>flat</b> keyword enables use of the entire 1024 to 65535 port range when allocating ports. When choosing the mapped port number for a translation, the ASA uses the real source port number if it is available. However, without this option, if the real port is <i>not</i> available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also specify the <b>include-reserve</b> keyword.</p> <p>(continued)</p> |

If you specify <b>interface</b>, be sure to also configure the <b>service</b> keyword. For this option, you must configure a specific interface for the <i>real_ifc</i>. See the “<a href="#">Static Interface NAT with Port Translation</a>” section on page 29-5 for more information.</li> <li>– Real—Specify a network object or group (see <a href="#">Step 3</a>). For identity NAT, simply use the same object or group for both the real and mapped addresses.</li> </ul> </li> <li>• Destination port—(Optional) Specify the <b>service</b> keyword along with the real and mapped service objects (see <a href="#">Step 5</a>). For identity port translation, simply use the same service object for both the real and mapped ports.</li> <li>• DNS—(Optional; for a source-only rule) The <b>dns</b> keyword translates DNS replies. Be sure DNS inspection is enabled (it is enabled by default). You cannot configure the <b>dns</b> keyword if you configure a <b>destination</b> address. See the “<a href="#">DNS and NAT</a>” section on page 29-24 for more information.</li> <li>• Inactive—(Optional) To make this rule inactive without having to remove the command, use the <b>inactive</b> keyword. To reactivate it, reenter the whole command without the <b>inactive</b> keyword.</li> <li>• Description—(Optional) Provide a description up to 200 characters using the <b>description</b> keyword.</li> </ul> |

## Configuring Static NAT or Static NAT-with-Port-Translation

This section describes how to configure a static NAT rule using twice NAT. For more information about static NAT, see the [“Static NAT” section on page 29-3](#).

### Detailed Steps

|        | Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p>Network object:</p> <pre>object network obj_name   {host ip_address   subnet   subnet_address netmask   range   ip_address_1 ip_address_2}</pre> <p>Network object group:</p> <pre>object-group network grp_name   {network-object {object net_obj_name     subnet_address netmask     host ip_address}     group-object grp_obj_name}</pre> <p><b>Example:</b></p> <pre>hostname(config)# object network MyInsNet hostname(config-network-object)# subnet 10.1.1.0 255.255.255.0</pre>           | <p>Configure the <b>real source</b> addresses.</p> <p>You can configure either a network object or a network object group. For more information, see the <a href="#">“Configuring Objects” section on page 13-3</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 2 | <p>Network object:</p> <pre>object network obj_name   {host ip_address   subnet   subnet_address netmask   range   ip_address_1 ip_address_2}</pre> <p>Network object group:</p> <pre>object-group network grp_name   {network-object {object net_obj_name     subnet_address netmask     host ip_address}     group-object grp_obj_name}</pre> <p><b>Example:</b></p> <pre>hostname(config)# object network MyInsNet_mapped hostname(config-network-object)# subnet 192.168.1.0 255.255.255.0</pre> | <p>Configure the <b>mapped source</b> addresses.</p> <p>You can configure either a network object or a network object group. For static NAT, the mapping is typically one-to-one, so the real addresses have the same quantity as the mapped addresses. You can, however, have different quantities if desired. For more information, see the <a href="#">“Static NAT” section on page 29-3</a>.</p> <p>For static interface NAT with port translation (routed mode only), you can skip this step and specify the <b>interface</b> keyword instead of a network object/group for the mapped address. For more information, see the <a href="#">“Static Interface NAT with Port Translation” section on page 29-5</a>.</p> <p>See the <a href="#">“Guidelines and Limitations” section on page 31-2</a> for information about disallowed mapped IP addresses.</p> |

|        | Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <p>(Optional)</p> <p>Network object:</p> <pre>object network obj_name   {host ip_address   subnet   subnet_address netmask   range   ip_address_1 ip_address_2}</pre> <p>Network object group:</p> <pre>object-group network grp_name   {network-object {object net_obj_name     subnet_address netmask     host ip_address}     group-object grp_obj_name}</pre> <p><b>Example:</b></p> <pre>hostname(config)# object network Server1 hostname(config-network-object)# host 209.165.201.8</pre>    | <p>Configure the <b>real destination</b> addresses.</p> <p>You can configure either a network object or a network object group.</p> <p>Although the main feature of twice NAT is the inclusion of the destination IP address, the destination address is optional. If you do specify the destination address, you can configure static translation for that address or just use identity NAT for it. You might want to configure twice NAT without a destination address to take advantage of some of the other qualities of twice NAT, including the use of network object groups for real addresses, or manually ordering of rules. For more information, see the <a href="#">“Main Differences Between Network Object NAT and Twice NAT”</a> section on page 29-16.</p>                                                                                                                                                                            |
| Step 4 | <p>(Optional)</p> <p>Network object:</p> <pre>object network obj_name   {host ip_address   subnet   subnet_address netmask   range   ip_address_1 ip_address_2}</pre> <p>Network object group:</p> <pre>object-group network grp_name   {network-object {object net_obj_name     subnet_address netmask     host ip_address}     group-object grp_obj_name}</pre> <p><b>Example:</b></p> <pre>hostname(config)# object network Server1_mapped hostname(config-network-object)# host 10.1.1.67</pre> | <p>Configure the <b>mapped destination</b> addresses.</p> <p>The destination translation is always static. For identity NAT, you can skip this step and simply use the same object or group for both the real and mapped addresses.</p> <p>If you want to translate the destination address, you can configure either a network object or a network object group. The static mapping is typically one-to-one, so the real addresses have the same quantity as the mapped addresses. You can, however, have different quantities if desired. For more information, see the <a href="#">“Static NAT”</a> section on page 29-3.</p> <p>For static interface NAT with port translation (routed mode only), you can skip this step and specify the <b>interface</b> keyword instead of a network object/group for the mapped address. For more information, see the <a href="#">“Static Interface NAT with Port Translation”</a> section on page 29-5.</p> |

|        | Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <p data-bbox="228 254 789 296">(Optional)</p> <pre data-bbox="228 296 789 390">object service obj_name   service {tcp   udp} [source operator     port] [destination operator port]</pre> <p data-bbox="228 464 789 495"><b>Example:</b></p> <pre data-bbox="228 495 789 600">hostname(config)# object service REAL_SRC_SVC hostname(config-service-object)# service tcp source eq 80  hostname(config)# object service MAPPED_SRC_SVC hostname(config-service-object)# service tcp source eq 8080</pre> | <p data-bbox="789 254 1536 296">Configure service objects for:</p> <ul data-bbox="789 296 1536 390" style="list-style-type: none"><li>• <b>Source <i>or</i> destination real port</b></li><li>• <b>Source <i>or</i> destination mapped port</b></li></ul> <p data-bbox="789 390 1536 716">A service object can contain both a source and destination port; however, you should specify <i>either</i> the source <i>or</i> the destination port for both service objects. You should only specify <i>both</i> the source and destination ports if your application uses a fixed source port (such as some DNS servers); but fixed source ports are rare. NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports. The “not equal” (<b>neq</b>) operator is not supported.</p> <p data-bbox="789 716 1536 798">For example, if you want to translate the port for the source host, then configure the source service.</p> |

Step 6

| Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | <p>(Continued)</p> <ul style="list-style-type: none"> <li>• <b>Ports</b>—(Optional) Specify the <b>service</b> keyword along with the real and mapped service objects (see <a href="#">Step 5</a>). For source port translation, the objects must specify the source service. The order of the service objects in the command for source port translation is <b>service real_obj mapped_obj</b>. For destination port translation, the objects must specify the destination service. The order of the service objects for destination port translation is <b>service mapped_obj real_obj</b>. In the rare case where you specify both the source and destination ports in the object, the first service object contains the real source port/mapped destination port; the second service object contains the mapped source port/real destination port. For identity port translation, simply use the same service object for both the real and mapped ports (source and/or destination ports, depending on your configuration).</li> <li>• <b>DNS</b>—(Optional; for a source-only rule) The <b>dns</b> keyword translates DNS replies. Be sure DNS inspection is enabled (it is enabled by default). You cannot configure the <b>dns</b> keyword if you configure a <b>destination</b> address. See the “<a href="#">DNS and NAT</a>” section on page 29-24 for more information.</li> <li>• <b>No Proxy ARP</b>—(Optional) Specify <b>no-proxy-arp</b> to disable proxy ARP for incoming packets to the mapped IP addresses. See the “<a href="#">Mapped Addresses and Routing</a>” section on page 29-22 for more information.</li> <li>• <b>Inactive</b>—(Optional) To make this rule inactive without having to remove the command, use the <b>inactive</b> keyword. To reactivate it, reenter the whole command without the <b>inactive</b> keyword.</li> <li>• <b>Description</b>—(Optional) Provide a description up to 200 characters using the <b>description</b> keyword.</li> </ul> |

## Examples

The following example shows the use of static interface NAT with port translation. Hosts on the outside access an FTP server on the inside by connecting to the outside interface IP address with destination port 65000 through 65004. The traffic is untranslated to the internal FTP server at 192.168.10.100:6500 through :65004. Note that you specify the source port range in the service object (and not the destination port) because you want to translate the source address and port as identified in the command; the destination port is “any.” Because static NAT is bidirectional, “source” and “destination” refers primarily to the command keywords; the actual source and destination address and port in a packet depends on

which host sent the packet. In this example, connections are originated from outside to inside, so the “source” address and port of the FTP server is actually the destination address and port in the originating packet.

```
hostname(config)# object service FTP_PASV_PORT_RANGE
hostname(config-service-object)# service tcp source range 65000 65004

hostname(config)# object network HOST_FTP_SERVER
hostname(config-network-object)# host 192.168.10.100

hostname(config)# nat (inside,outside) source static HOST_FTP_SERVER interface service
FTP_PASV_PORT_RANGE FTP_PASV_PORT_RANGE
```

## Configuring Identity NAT

This section describes how to configure an identity NAT rule using twice NAT. For more information about identity NAT, see the [“Identity NAT” section on page 29-11](#).

### Detailed Steps

|        | Command                                                                                                                                                                                     | Purpose                                                                                                                                                                                              |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | Network object:                                                                                                                                                                             | Configure the <b>real source</b> addresses.                                                                                                                                                          |
|        | <pre>object network obj_name   {host ip_address   subnet   subnet_address netmask   range   ip_address_1 ip_address_2}</pre>                                                                | <p>You can configure either a network object or a network object group. For more information, see the <a href="#">“Configuring Objects” section on page 13-3</a>.</p>                                |
|        | <p>Network object group:</p> <pre>object-group network grp_name   {network-object {object net_obj_name     subnet_address netmask     host ip_address}     group-object grp_obj_name}</pre> | <p>These are the addresses on which you want to perform identity NAT. If you want to perform identity NAT for all addresses, you can skip this step and instead use the keywords <b>any any</b>.</p> |
|        | <p><b>Example:</b></p> <pre>hostname(config)# object network MyInsNet hostname(config-network-object)# subnet 10.1.1.0 255.255.255.0</pre>                                                  |                                                                                                                                                                                                      |

|               | Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <p>(Optional)</p> <p>Network object:</p> <pre>object network obj_name   {host ip_address   subnet   subnet_address netmask   range   ip_address_1 ip_address_2}</pre> <p>Network object group:</p> <pre>object-group network grp_name   {network-object {object net_obj_name     subnet_address netmask     host ip_address}     group-object grp_obj_name}</pre> <p><b>Example:</b></p> <pre>hostname(config)# object network Server1 hostname(config-network-object)# host 209.165.201.8</pre>    | <p>Configure the <b>real destination</b> addresses.</p> <p>You can configure either a network object or a network object group.</p> <p>Although the main feature of twice NAT is the inclusion of the destination IP address, the destination address is optional. If you do specify the destination address, you can configure static translation for that address or just use identity NAT for it. You might want to configure twice NAT without a destination address to take advantage of some of the other qualities of twice NAT, including the use of network object groups for real addresses, or manually ordering of rules. For more information, see the <a href="#">“Main Differences Between Network Object NAT and Twice NAT”</a> section on page 29-16.</p>                                                                                                                                                                            |
| <b>Step 3</b> | <p>(Optional)</p> <p>Network object:</p> <pre>object network obj_name   {host ip_address   subnet   subnet_address netmask   range   ip_address_1 ip_address_2}</pre> <p>Network object group:</p> <pre>object-group network grp_name   {network-object {object net_obj_name     subnet_address netmask     host ip_address}     group-object grp_obj_name}</pre> <p><b>Example:</b></p> <pre>hostname(config)# object network Server1_mapped hostname(config-network-object)# host 10.1.1.67</pre> | <p>Configure the <b>mapped destination</b> addresses.</p> <p>The destination translation is always static. For identity NAT, you can skip this step and simply use the same object or group for both the real and mapped addresses.</p> <p>If you want to translate the destination address, you can configure either a network object or a network object group. The static mapping is typically one-to-one, so the real addresses have the same quantity as the mapped addresses. You can, however, have different quantities if desired. For more information, see the <a href="#">“Static NAT”</a> section on page 29-3.</p> <p>For static interface NAT with port translation (routed mode only), you can skip this step and specify the <b>interface</b> keyword instead of a network object/group for the mapped address. For more information, see the <a href="#">“Static Interface NAT with Port Translation”</a> section on page 29-5.</p> |

|        | Command                                                                                                                                                                                                                                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <p>(Optional)</p> <pre>object service obj_name   service {tcp   udp} [source operator     port] [destination operator port]</pre> <p><b>Example:</b></p> <pre>hostname(config)# object service REAL_SRC_SVC hostname(config-service-object)# service tcp source eq 80</pre> <pre>hostname(config)# object service MAPPED_SRC_SVC hostname(config-service-object)# service tcp source eq 8080</pre> | <p>Configure service objects for:</p> <ul style="list-style-type: none"> <li>• <b>Source <i>or</i> destination real port</b></li> <li>• <b>Source <i>or</i> destination mapped port</b></li> </ul> <p>A service object can contain both a source and destination port; however, you should specify <i>either</i> the source <i>or</i> the destination port for both service objects. You should only specify <i>both</i> the source and destination ports if your application uses a fixed source port (such as some DNS servers); but fixed source ports are rare. NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports. The “not equal” (<b>neq</b>) operator is not supported.</p> <p>For example, if you want to translate the port for the source host, then configure the source service.</p> |

| Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Step 5</b></p> <pre> <b>nat</b> [(<i>real_ifc</i>,<i>mapped_ifc</i>)] [<i>line</i>   {<b>after-object</b> [<i>line</i>]}] <b>source static</b> {<i>nw_obj nw_obj</i>   <b>any any</b>} [<b>destination static</b> {<i>mapped_obj</i>   <b>interface</b> } <i>real_obj</i>] [<b>service</b> <i>real_src_mapped_dest_svc_obj</i> <i>mapped_src_real_dest_svc_obj</i>] [<b>no-proxy-arp</b>] [<b>route-lookup</b>] [<b>inactive</b>] [<b>description</b> <i>desc</i>] </pre> <p><b>Example:</b></p> <pre> hostname(config)# nat (inside,outside) source static MyInsNet MyInsNet destination static Server1 Server1 </pre> | <p>Configures <b>identity</b> NAT. See the following guidelines:</p> <ul style="list-style-type: none"> <li>• <b>Interfaces</b>—(Required for transparent mode) Specify the real and mapped interfaces. Be sure to include the parentheses in your command. In routed mode, if you do not specify the real and mapped interfaces, all interfaces are used; you can also specify the keyword <b>any</b> for one or both of the interfaces.</li> <li>• <b>Section and Line</b>—(Optional) By default, the NAT rule is added to the end of section 1 of the NAT table. See the “<a href="#">NAT Rule Order</a>” section on page 29-20 for more information about sections. If you want to add the rule into section 3 instead (after the network object NAT rules), then use the <b>after-auto</b> keyword. You can insert a rule anywhere in the applicable section using the <i>line</i> argument.</li> <li>• <b>Source addresses</b>—Specify a network object, group, or the <b>any</b> keyword for both the real and mapped addresses (see <a href="#">Step 1</a>).</li> <li>• <b>Destination addresses</b> (Optional): <ul style="list-style-type: none"> <li>– <b>Mapped</b>—Specify a network object or group, or for static interface NAT with port translation only, specify the <b>interface</b> keyword (routed mode only) (see <a href="#">Step 3</a>). If you specify <b>interface</b>, be sure to also configure the <b>service</b> keyword (in this case, the service objects should include only the destination port). For this option, you must configure a specific interface for the <i>real_ifc</i>. See the “<a href="#">Static Interface NAT with Port Translation</a>” section on page 29-5 for more information.</li> <li>– <b>Real</b>—Specify a network object or group (see <a href="#">Step 2</a>). For identity NAT, simply use the same object or group for both the real and mapped addresses.</li> </ul> </li> <li>• <b>Port</b>—(Optional) Specify the <b>service</b> keyword along with the real and mapped service objects (see <a href="#">Step 4</a>). For source port translation, the objects must specify the source service. The order of the service objects in the command for source port translation is <b>service</b> <i>real_obj mapped_obj</i>. For destination port translation, the objects must specify the destination service. The order of the service objects for destination port translation is <b>service</b> <i>mapped_obj real_obj</i>. In the rare case where you specify both the source and destination ports in the object, the first service object contains the real source port/mapped destination port; the second service object contains the mapped source port/real destination port. For identity port translation, simply use the same service object for both the real and mapped ports (source and/or destination ports, depending on your configuration).</li> </ul> |

| Command | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | (Continued) <ul style="list-style-type: none"> <li>No Proxy ARP—(Optional) Specify <b>no-proxy-arp</b> to disable proxy ARP for incoming packets to the mapped IP addresses. See the <a href="#">“Mapped Addresses and Routing”</a> section on page 29-22 for more information.</li> <li>Route lookup—(Optional; routed mode only; interface(s) specified) Specify <b>route-lookup</b> to determine the egress interface using a route lookup instead of using the interface specified in the NAT command. See the <a href="#">“Determining the Egress Interface”</a> section on page 29-24 for more information.</li> <li>Inactive—(Optional) To make this rule inactive without having to remove the command, use the <b>inactive</b> keyword. To reactivate it, reenter the whole command without the <b>inactive</b> keyword.</li> <li>Description—(Optional) Provide a description up to 200 characters using the <b>description</b> keyword.</li> </ul> |

## Monitoring Twice NAT

To monitor twice NAT, enter one of the following commands:

| Command              | Purpose                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>show nat</b>      | Shows NAT statistics, including hits for each NAT rule.                                                         |
| <b>show nat pool</b> | Shows NAT pool statistics, including the addresses and ports allocated, and how many times they were allocated. |
| <b>show xlate</b>    | Shows current NAT session information.                                                                          |

## Configuration Examples for Twice NAT

This section includes the following configuration examples:

- [Different Translation Depending on the Destination \(Dynamic PAT\), page 31-24](#)
- [Different Translation Depending on the Destination Address and Port \(Dynamic PAT\), page 31-26](#)

### Different Translation Depending on the Destination (Dynamic PAT)

[Figure 31-1](#) shows a host on the 10.1.2.0/24 network accessing two different servers. When the host accesses the server at 209.165.201.11, the real address is translated to 209.165.202.129:port. When the host accesses the server at 209.165.200.225, the real address is translated to 209.165.202.130:port.

**Figure 31-1** Twice NAT with Different Destination Addresses

**Step 1** Add a network object for the inside network:

```
hostname(config)# object network myInsideNetwork
hostname(config-network-object)# subnet 10.1.2.0 255.255.255.0
```

**Step 2** Add a network object for the DMZ network 1:

```
hostname(config)# object network DMZnetwork1
hostname(config-network-object)# subnet 209.165.201.0 255.255.255.224
```

**Step 3** Add a network object for the PAT address:

```
hostname(config)# object network PATaddress1
hostname(config-network-object)# host 209.165.202.129
```

**Step 4** Configure the first twice NAT rule:

```
hostname(config)# nat (inside,dmz) source dynamic myInsideNetwork PATaddress1 destination
static DMZnetwork1 DMZnetwork1
```

Because you do not want to translate the destination address, you need to configure identity NAT for it by specifying the same address for the real and mapped destination addresses.

By default, the NAT rule is added to the end of section 1 of the NAT table. See the [“Configuring Dynamic PAT \(Hide\)” section on page 31-8](#) for more information about specifying the section and line number for the NAT rule.

**Step 5** Add a network object for the DMZ network 2:

```
hostname(config)# object network DMZnetwork2
hostname(config-network-object)# subnet 209.165.200.224 255.255.255.224
```

**Step 6** Add a network object for the PAT address:

```
hostname(config)# object network PATaddress2
```

```
hostname(config-network-object)# host 209.165.202.130
```

**Step 7** Configure the second twice NAT rule:

```
hostname(config)# nat (inside,dmz) source dynamic myInsideNetwork PATaddress2 destination
static DMZnetwork2 DMZnetwork2
```

## Different Translation Depending on the Destination Address and Port (Dynamic PAT)

Figure 31-2 shows the use of source and destination ports. The host on the 10.1.2.0/24 network accesses a single host for both web services and Telnet services. When the host accesses the server for web services, the real address is translated to 209.165.202.129:port. When the host accesses the same server for Telnet services, the real address is translated to 209.165.202.130:port.

**Figure 31-2** Twice NAT with Different Destination Ports

**Step 1** Add a network object for the inside network:

```
hostname(config)# object network myInsideNetwork
hostname(config-network-object)# subnet 10.1.2.0 255.255.255.0
```

**Step 2** Add a network object for the Telnet/Web server:

```
hostname(config)# object network TelnetWebServer
hostname(config-network-object)# host 209.165.201.11
```

**Step 3** Add a network object for the PAT address when using Telnet:

```
hostname(config)# object network PATaddress1
```

```
hostname(config-network-object)# host 209.165.202.129
```

**Step 4** Add a service object for Telnet:

```
hostname(config)# object service TelnetObj
hostname(config-network-object)# service tcp destination eq telnet
```

**Step 5** Configure the first twice NAT rule:

```
hostname(config)# nat (inside,outside) source dynamic myInsideNetwork PATaddress1
destination static TelnetWebServer TelnetWebServer service TelnetObj TelnetObj
```

Because you do not want to translate the destination address or port, you need to configure identity NAT for them by specifying the same address for the real and mapped destination addresses, and the same port for the real and mapped service.

By default, the NAT rule is added to the end of section 1 of the NAT table, See the [“Configuring Dynamic PAT \(Hide\)” section on page 31-8](#) for more information about specifying the section and line number for the NAT rule.

**Step 6** Add a network object for the PAT address when using HTTP:

```
hostname(config)# object network PATaddress2
hostname(config-network-object)# host 209.165.202.130
```

**Step 7** Add a service object for HTTP:

```
hostname(config)# object service HTTPObj
hostname(config-network-object)# service tcp destination eq http
```

**Step 8** Configure the second twice NAT rule:

```
hostname(config)# nat (inside,outside) source dynamic myInsideNetwork PATaddress2
destination static TelnetWebServer TelnetWebServer service HTTPObj HTTPObj
```

---

# Feature History for Twice NAT

Table 31-1 lists each feature change and the platform release in which it was implemented.

**Table 31-1** Feature History for Twice NAT

| Feature Name                                         | Platform Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Twice NAT                                            | 8.3(1)            | Twice NAT lets you identify both the source and destination address in a single rule.<br><br>We modified or introduced the following commands: <b>nat</b> , <b>show nat</b> , <b>show xlate</b> , <b>show nat pool</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Identity NAT configurable proxy ARP and route lookup | 8.4(2)            | In earlier releases for identity NAT, proxy ARP was disabled, and a route lookup was always used to determine the egress interface. You could not configure these settings. In 8.4(2) and later, the default behavior for identity NAT was changed to match the behavior of other static NAT configurations: proxy ARP is enabled, and the NAT configuration determines the egress interface (if specified) by default. You can leave these settings as is, or you can enable or disable them discretely. Note that you can now also disable proxy ARP for regular static NAT.<br><br>For pre-8.3 configurations, the migration of NAT exempt rules (the <b>nat 0 access-list</b> command) to 8.4(2) and later now includes the following keywords to disable proxy ARP and to use a route lookup: <b>no-proxy-arp</b> and <b>route-lookup</b> . The <b>unidirectional</b> keyword that was used for migrating to 8.3(2) and 8.4(1) is no longer used for migration. When upgrading to 8.4(2) from 8.3(1), 8.3(2), and 8.4(1), all identity NAT configurations will now include the <b>no-proxy-arp</b> and <b>route-lookup</b> keywords, to maintain existing functionality. The <b>unidirectional</b> keyword is removed.<br><br>We modified the following commands: <b>nat source static [no-proxy-arp] [route-lookup]</b> . |
| PAT pool and round robin address assignment          | 8.4(2)            | You can now specify a pool of PAT addresses instead of a single address. You can also optionally enable round-robin assignment of PAT addresses instead of first using all ports on a PAT address before using the next address in the pool. These features help prevent a large number of connections from a single PAT address from appearing to be part of a DoS attack and makes configuration of large numbers of PAT addresses easy.<br><br>We modified the following commands: <b>nat source dynamic [pat-pool mapped_object [round-robin]]</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 31-1**      **Feature History for Twice NAT (continued)**

| Feature Name                                                                | Platform Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------------------------|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Round robin PAT pool allocation uses the same IP address for existing hosts | 8.4(3)            | <p>When using a PAT pool with round robin allocation, if a host has an existing connection, then subsequent connections from that host will use the same PAT IP address if ports are available.</p> <p>We did not modify any commands.</p> <p><i>This feature is not available in 8.5(1).</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Flat range of PAT ports for a PAT pool                                      | 8.4(3)            | <p>If available, the real source port number is used for the mapped port. However, if the real port is <i>not</i> available, by default the mapped ports are chosen from the same range of ports as the real port number: 0 to 511, 512 to 1023, and 1024 to 65535. Therefore, ports below 1024 have only a small PAT pool.</p> <p>If you have a lot of traffic that uses the lower port ranges, when using a PAT pool, you can now specify a flat range of ports to be used instead of the three unequal-sized tiers: either 1024 to 65535, or 1 to 65535.</p> <p>We modified the following commands: <b>nat source dynamic [pat-pool mapped_object [flat [include-reserve]]]</b>.</p> <p><i>This feature is not available in 8.5(1).</i></p> |

Table 31-1 Feature History for Twice NAT (continued)

| Feature Name                                                                                      | Platform Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Extended PAT for a PAT pool                                                                       | 8.4(3)            | <p>Each PAT IP address allows up to 65535 ports. If 65535 ports do not provide enough translations, you can now enable extended PAT for a PAT pool. Extended PAT uses 65535 ports per <i>service</i>, as opposed to per IP address, by including the destination address and port in the translation information.</p> <p>We modified the following commands: <b>nat source dynamic [pat-pool mapped_object [extended]]</b>.</p> <p><i>This feature is not available in 8.5(1).</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Automatic NAT rules to translate a VPN peer's local IP address back to the peer's real IP address | 8.4(3)            | <p>In rare situations, you might want to use a VPN peer's real IP address on the inside network instead of an assigned local IP address. Normally with VPN, the peer is given an assigned local IP address to access the inside network. However, you might want to translate the local IP address back to the peer's real public IP address if, for example, your inside servers and network security is based on the peer's real IP address.</p> <p>You can enable this feature on one interface per tunnel group. Object NAT rules are dynamically added and deleted when the VPN session is established or disconnected. You can view the rules using the <b>show nat</b> command.</p> <p><b>Note</b> Because of routing issues, we do not recommend using this feature unless you know you need this feature; contact Cisco TAC to confirm feature compatibility with your network. See the following limitations:</p> <ul style="list-style-type: none"> <li>• Only supports Cisco IPsec and AnyConnect Client.</li> <li>• Return traffic to the public IP addresses must be routed back to the ASA so the NAT policy and VPN policy can be applied.</li> <li>• Does not support load-balancing (because of routing issues).</li> <li>• Does not support roaming (public IP changing).</li> </ul> <p>We introduced the following command:<br/> <b>nat-assigned-to-public-ip interface</b> (tunnel-group general-attributes configuration mode).</p> |

## **PART 8**

### **Configuring Service Policies Using the Modular Policy Framework**

## CHAPTER 32

# Configuring a Service Policy Using the Modular Policy Framework

---

Service policies using Modular Policy Framework provide a consistent and flexible way to configure ASA features. For example, you can use a service policy to create a timeout configuration that is specific to a particular TCP application, as opposed to one that applies to all TCP applications. A service policy consists of multiple actions applied to an interface or applied globally.

This chapter includes the following sections:

- [Information About Service Policies, page 32-1](#)
- [Licensing Requirements for Service Policies, page 32-6](#)
- [Guidelines and Limitations, page 32-6](#)
- [Default Settings, page 32-8](#)
- [Task Flows for Configuring Service Policies, page 32-9](#)
- [Identifying Traffic \(Layer 3/4 Class Maps\), page 32-12](#)
- [Defining Actions \(Layer 3/4 Policy Map\), page 32-15](#)
- [Applying Actions to an Interface \(Service Policy\), page 32-17](#)
- [Monitoring Modular Policy Framework, page 32-18](#)
- [Configuration Examples for Modular Policy Framework, page 32-18](#)
- [Feature History for Service Policies, page 32-21](#)

## Information About Service Policies

This section describes how service policies work and includes the following topics:

- [Supported Features for Through Traffic, page 32-2](#)
- [Supported Features for Management Traffic, page 32-2](#)
- [Feature Directionality, page 32-2](#)
- [Feature Matching Within a Service Policy, page 32-3](#)
- [Order in Which Multiple Feature Actions are Applied, page 32-4](#)
- [Incompatibility of Certain Feature Actions, page 32-5](#)
- [Feature Matching for Multiple Service Policies, page 32-6](#)

## Supported Features for Through Traffic

Table 32-1 lists the features supported by Modular Policy Framework.

**Table 32-1**      *Modular Policy Framework*

| Feature                                                                           | See:                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| TCP and UDP connection limits and timeouts, and TCP sequence number randomization | Chapter 53, “Configuring Connection Settings.”                                                                                                                                                                                                                                                                                                                                                                                                             |
| TCP normalization                                                                 | Chapter 53, “Configuring Connection Settings.”                                                                                                                                                                                                                                                                                                                                                                                                             |
| TCP state bypass                                                                  | Chapter 53, “Configuring Connection Settings.”                                                                                                                                                                                                                                                                                                                                                                                                             |

## Supported Features for Management Traffic

Modular Policy Framework supports the following features for management traffic:

- Application inspection for RADIUS accounting traffic—See Chapter 46, “Configuring Inspection for Management Application Protocols.”
- Connection limits—See Chapter 53, “Configuring Connection Settings.”

## Feature Directionality

Actions are applied to traffic bidirectionally or unidirectionally depending on the feature. For features that are applied bidirectionally, all traffic that enters or exits the interface to which you apply the policy map is affected if the traffic matches the class map for both directions.

**Note**

When you use a global policy, all features are unidirectional; features that are normally bidirectional when applied to a single interface only apply to the ingress of each interface when applied globally. Because the policy is applied to all interfaces, the policy will be applied in both directions so bidirectionality in this case is redundant.

For features that are applied unidirectionally, for example QoS priority queue, only traffic that enters (or exits, depending on the feature) the interface to which you apply the policy map is affected. See [Table 32-2](#) for the directionality of each feature.

**Table 32-2**      **Feature Directionality**

| Feature                                                                           | Single Interface Direction | Global Direction |
|-----------------------------------------------------------------------------------|----------------------------|------------------|
| Application inspection (multiple types)                                           | Bidirectional              | Ingress          |
| CSC                                                                               | Bidirectional              | Ingress          |
| IPS                                                                               | Bidirectional              | Ingress          |
| NetFlow Secure Event Logging filtering                                            | N/A                        | Ingress          |
| QoS input policing                                                                | Ingress                    | Ingress          |
| QoS output policing                                                               | Egress                     | Egress           |
| QoS standard priority queue                                                       | Egress                     | Egress           |
| QoS traffic shaping, hierarchical priority queue                                  | Egress                     | Egress           |

## Feature Matching Within a Service Policy

See the following information for how a packet matches class maps in a policy map for a given interface:

1. A packet can match only one class map in the policy map for each feature type.
2. When the packet matches a class map for a feature type, the ASA does not attempt to match it to any subsequent class maps for that feature type.
3. If the packet matches a subsequent class map for a different feature type, however, then the ASA also applies the actions for the subsequent class map, if supported. See the [“Incompatibility of Certain Feature Actions”](#) section on page 32-5 for more information about unsupported combinations.

For example, if a packet matches a class map for connection limits, and also matches a class map for application inspection, then both actions are applied.

If a packet matches a class map for HTTP inspection, but also matches another class map that includes HTTP inspection, then the second class map actions are not applied.

**Note**

Application inspection includes multiple inspection types, and each inspection type is a separate feature when you consider the matching guidelines above.

## Order in Which Multiple Feature Actions are Applied

The order in which different types of actions in a policy map are performed is independent of the order in which the actions appear in the policy map.

**Note**

NetFlow Secure Event Logging filtering is order-independent.

Actions are performed in the following order:

1. QoS input policing
2. TCP normalization, TCP and UDP connection limits and timeouts, TCP sequence number randomization, and TCP state bypass.

**Note**

When a the ASA performs a proxy service (such as AAA or CSC) or it modifies the TCP payload (such as FTP inspection), the TCP normalizer acts in dual mode, where it is applied before and after the proxy or payload modifying service.

3. CSC
4. Application inspection (multiple types)

The order of application inspections applied when a class of traffic is classified for multiple inspections is as follows. Only one inspection type can be applied to the same traffic. WAAS inspection is an exception, because it can be applied along with other inspections for the same traffic. See the [“Incompatibility of Certain Feature Actions” section on page 32-5](#) for more information.

- a. CTIQBE
- b. DNS
- c. FTP
- d. GTP
- e. H323
- f. HTTP
- g. ICMP
- h. ICMP error
- i. ILS
- j. MGCP
- k. NetBIOS
- l. PPTP
- m. Sun RPC
- n. RSH
- o. RTSP
- p. SIP
- q. Skinny
- r. SMTP

- s. SNMP
- t. SQL\*Net
- u. TFTP
- v. XDMCP
- w. DCERPC
- x. Instant Messaging

**Note** RADIUS accounting is not listed because it is the only inspection allowed on management traffic. WAAS is not listed because it can be configured along with other inspections for the same traffic.

- 5. IPS
- 6. QoS output policing
- 7. QoS standard priority queue
- 8. QoS traffic shaping, hierarchical priority queue

## Incompatibility of Certain Feature Actions

Some features are not compatible with each other for the same traffic. For example, you cannot configure QoS priority queueing and QoS policing for the same set of traffic. Also, most inspections should not be combined with another inspection, so the ASA only applies one inspection if you configure multiple inspections for the same traffic. In this case, the feature that is applied is the higher priority feature in the list in the [“Order in Which Multiple Feature Actions are Applied”](#) section on page 32-4.

For information about compatibility of each feature, see the chapter or section for your feature.

**Note**

The **match default-inspection-traffic** command, which is used in the default global policy, is a special CLI shortcut to match the default ports for all inspections. When used in a policy map, this class map ensures that the correct inspection is applied to each packet, based on the destination port of the traffic. For example, when UDP traffic for port 69 reaches the ASA, then the ASA applies the TFTP inspection; when TCP traffic for port 21 arrives, then the ASA applies the FTP inspection. So in this case only, you can configure multiple inspections for the same class map. Normally, the ASA does not use the port number to determine which inspection to apply, thus giving you the flexibility to apply inspections to non-standard ports, for example.

An example of a misconfiguration is if you configure multiple inspections in the same policy map and do not use the default-inspection-traffic shortcut. In [Example 32-1](#), traffic destined to port 21 is mistakenly configured for both FTP and HTTP inspection. In [Example 32-2](#), traffic destined to port 80 is mistakenly configured for both FTP and HTTP inspection. In both cases of misconfiguration examples, only the FTP inspection is applied, because FTP comes before HTTP in the order of inspections applied.

### **Example 32-1 Misconfiguration for FTP packets: HTTP Inspection Also Configured**

```
class-map ftp
 match port tcp eq 21
class-map http
```

```

match port tcp eq 21 [it should be 80]
policy-map test
 class ftp
 inspect ftp
 class http
 inspect http

```

**Example 32-2 Misconfiguration for HTTP packets: FTP Inspection Also Configured**

```

class-map ftp
 match port tcp eq 80 [it should be 21]
class-map http
 match port tcp eq 80
policy-map test
 class http
 inspect http
 class ftp
 inspect ftp

```

## Feature Matching for Multiple Service Policies

For TCP and UDP traffic (and ICMP when you enable stateful ICMP inspection), service policies operate on traffic flows, and not just individual packets. If traffic is part of an existing connection that matches a feature in a policy on one interface, that traffic flow cannot also match the same feature in a policy on another interface; only the first policy is used.

For example, if HTTP traffic matches a policy on the inside interface to inspect HTTP traffic, and you have a separate policy on the outside interface for HTTP inspection, then that traffic is not also inspected on the egress of the outside interface. Similarly, the return traffic for that connection will not be inspected by the ingress policy of the outside interface, nor by the egress policy of the inside interface.

For traffic that is not treated as a flow, for example ICMP when you do not enable stateful ICMP inspection, returning traffic can match a different policy map on the returning interface. For example, if you configure IPS on the inside and outside interfaces, but the inside policy uses virtual sensor 1 while the outside policy uses virtual sensor 2, then a non-stateful Ping will match virtual sensor 1 outbound, but will match virtual sensor 2 inbound.

## Licensing Requirements for Service Policies

| Model      | License Requirement |
|------------|---------------------|
| All models | Base License.       |

## Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

### Context Mode Guidelines

Supported in single and multiple context mode.

### Firewall Mode Guidelines

Supported in routed and transparent firewall mode.

### IPv6 Guidelines

Supports IPv6 for the following features:

- Application inspection for FTP, HTTP, ICMP, SIP, SMTP and IPsec-pass-thru
- IPS
- NetFlow Secure Event Logging filtering
- TCP and UDP connection limits and timeouts, TCP sequence number randomization
- TCP normalization
- TCP state bypass

### Class Map Guidelines

The maximum number of class maps of all types is 255 in single mode or per context in multiple mode. Class maps include the following types:

- Layer 3/4 class maps (for through traffic and management traffic).
- Inspection class maps
- Regular expression class maps
- **match** commands used directly underneath an inspection policy map

This limit also includes default class maps of all types, limiting user-configured class maps to approximately 235. See the [“Default Class Maps” section on page 32-9](#).

### Policy Map Guidelines

See the following guidelines for using policy maps:

- You can only assign one policy map per interface. (However you can create up to 64 policy maps in the configuration.)
- You can apply the same policy map to multiple interfaces.
- You can identify up to 63 Layer 3/4 class maps in a Layer 3/4 policy map.
- For each class map, you can assign multiple actions from one or more feature types, if supported. See the [“Incompatibility of Certain Feature Actions” section on page 32-5](#).
- If you modify a policy map while it is in use by the service policy, your changes do not take effect unless you delete and readd the policy map.

### Service Policy Guidelines

- Interface service policies take precedence over the global service policy for a given feature. For example, if you have a global policy with FTP inspection, and an interface policy with TCP normalization, then both FTP inspection and TCP normalization are applied to the interface. However, if you have a global policy with FTP inspection, and an interface policy with FTP inspection, then only the interface policy FTP inspection is applied to that interface.
- You can only apply one global policy. For example, you cannot create a global policy that includes feature set 1, and a separate global policy that includes feature set 2. All features must be included in a single policy.

# Default Settings

The following topics describe the default settings for Modular Policy Framework:

- [Default Configuration, page 32-8](#)
- [Default Class Maps, page 32-9](#)

## Default Configuration

By default, the configuration includes a policy that matches all default application inspection traffic and applies certain inspections to the traffic on all interfaces (a global policy). Not all inspections are enabled by default. You can only apply one global policy, so if you want to alter the global policy, you need to either edit the default policy or disable it and apply a new one. (An interface policy overrides the global policy for a particular feature.)

The default policy includes the following application inspections:

- DNS inspection for the maximum message length of 512 bytes
- FTP
- H323 (H225)
- H323 (RAS)
- RSH
- RTSP
- ESMTP
- SQLnet
- Skinny (SCCP)
- SunRPC
- XDMCP
- SIP
- NetBios
- TFTP
- IP Options

The default policy configuration includes the following commands:

```
class-map inspection_default
 match default-inspection-traffic
policy-map type inspect dns preset_dns_map
 parameters
 message-length maximum 512
policy-map global_policy
 class inspection_default
 inspect dns preset_dns_map
 inspect ftp
 inspect h323 h225
 inspect h323 ras
 inspect rsh
 inspect rtsp
 inspect esmtp
 inspect sqlnet
```

```
inspect skinny
inspect sunrpc
inspect xdmcp
inspect sip
inspect netbios
inspect tftp
inspect ip-options
service-policy global_policy global
```

**Note**

See the [“Incompatibility of Certain Feature Actions”](#) section on page 32-5 for more information about the special **match default-inspection-traffic** command used in the default class map.

## Default Class Maps

The configuration includes a default Layer 3/4 class map that the ASA uses in the default global policy called default-inspection-traffic; it matches the default inspection traffic. This class, which is used in the default global policy, is a special shortcut to match the default ports for all inspections. When used in a policy, this class ensures that the correct inspection is applied to each packet, based on the destination port of the traffic. For example, when UDP traffic for port 69 reaches the ASA, then the ASA applies the TFTP inspection; when TCP traffic for port 21 arrives, then the ASA applies the FTP inspection. So in this case only, you can configure multiple inspections for the same class map. Normally, the ASA does not use the port number to determine which inspection to apply, thus giving you the flexibility to apply inspections to non-standard ports, for example.

```
class-map inspection_default
match default-inspection-traffic
```

Another class map that exists in the default configuration is called class-default, and it matches all traffic. This class map appears at the end of all Layer 3/4 policy maps and essentially tells the ASA to not perform any actions on all other traffic. You can use the class-default class if desired, rather than making your own **match any** class map. In fact, some features are only available for class-default, such as QoS traffic shaping.

```
class-map class-default
match any
```

## Task Flows for Configuring Service Policies

This section includes the following topics:

- [Task Flow for Using the Modular Policy Framework, page 32-9](#)
- [Task Flow for Configuring Hierarchical Policy Maps for QoS Traffic Shaping, page 32-11](#)

## Task Flow for Using the Modular Policy Framework

To configure Modular Policy Framework, perform the following steps:

- 
- Step 1** Identify the traffic—Identify the traffic on which you want to perform Modular Policy Framework actions by creating Layer 3/4 class maps.

For example, you might want to perform actions on all traffic that passes through the ASA; or you might only want to perform certain actions on traffic from 10.1.1.0/24 to any destination address.

See the “[Identifying Traffic \(Layer 3/4 Class Maps\)](#)” section on page 32-12.

- Step 2** Perform additional actions on some inspection traffic—If one of the actions you want to perform is application inspection, and you want to perform additional actions on some inspection traffic, then create an inspection policy map. The inspection policy map identifies the traffic and specifies what to do with it. For example, you might want to drop all HTTP requests with a body length greater than 1000 bytes.

You can create a self-contained inspection policy map that identifies the traffic directly with **match** commands, or you can create an inspection class map for reuse or for more complicated matching. See the “[Defining Actions in an Inspection Policy Map](#)” section on page 33-2 and the “[Identifying Traffic in an Inspection Class Map](#)” section on page 33-5.

- Step 3** Create a regular expression—If you want to match text with a regular expression within inspected packets, you can create a regular expression or a group of regular expressions (a regular expression class map). Then, when you define the traffic to match for the inspection policy map, you can call on an existing regular expression.

For example, you might want to drop all HTTP requests with a URL including the text “example.com.”

See the “[Creating a Regular Expression](#)” section on page 13-12 and the “[Creating a Regular Expression Class Map](#)” section on page 13-15.

- Step 4** Define the actions you want to perform and determine on which interfaces you want to apply the policy map—Define the actions you want to perform on each Layer 3/4 class map by creating a Layer 3/4 policy map. Then, determine on which interfaces you want to apply the policy map using a service policy.

See the “[Defining Actions \(Layer 3/4 Policy Map\)](#)” section on page 32-15 and the “[Applying Actions to an Interface \(Service Policy\)](#)” section on page 32-17.

## Task Flow for Configuring Hierarchical Policy Maps for QoS Traffic Shaping

If you enable QoS traffic shaping for a class map, then you can optionally enable priority queueing for a subset of shaped traffic. To do so, you need to create a policy map for the priority queueing, and then within the traffic shaping policy map, you can call the priority class map. Only the traffic shaping class map is applied to an interface.

See [Chapter 54, “Information About QoS,”](#) for more information about this feature.

Hierarchical policy maps are only supported for traffic shaping and priority queueing.

To implement a hierarchical policy map, perform the following steps:

- Step 1** Identify the prioritized traffic according to the “[Identifying Traffic \(Layer 3/4 Class Maps\)](#)” section on page 32-12.  
You can create multiple class maps to be used in the hierarchical policy map.
- Step 2** Create a policy map according to the “[Defining Actions \(Layer 3/4 Policy Map\)](#)” section on page 32-15, and identify the sole action for each class map as **priority**.
- Step 3** Create a separate policy map according to the “[Defining Actions \(Layer 3/4 Policy Map\)](#)” section on page 32-15, and identify the **shape** action for the **class-default** class map.

Traffic shaping can only be applied to the **class-default** class map.

- Step 4** For the same class map, identify the priority policy map that you created in Step 2 using the **service-policy** *priority\_policy\_map* command.
- Step 5** Apply the shaping policy map to the interface according to [“Applying Actions to an Interface \(Service Policy\)” section on page 32-17](#).

## Identifying Traffic (Layer 3/4 Class Maps)

A Layer 3/4 class map identifies Layer 3 and 4 traffic to which you want to apply actions. You can create multiple Layer 3/4 class maps for each Layer 3/4 policy map.

This section includes the following topics:

- [Creating a Layer 3/4 Class Map for Through Traffic, page 32-12](#)
- [Creating a Layer 3/4 Class Map for Management Traffic, page 32-15](#)

## Creating a Layer 3/4 Class Map for Through Traffic

A Layer 3/4 class map matches traffic based on protocols, ports, IP addresses and other Layer 3 or 4 attributes.

### Detailed Steps

|               | Command                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                               |
|---------------|---------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>class-map</b> <i>class_map_name</i><br><br><b>Example:</b><br>hostname(config)# class-map all_udp                            | Creates a Layer 3/4 class map, where <i>class_map_name</i> is a string up to 40 characters in length. The name “class-default” is reserved. All types of class maps use the same name space, so you cannot reuse a name already used by another type of class map. The CLI enters class-map configuration mode.                       |
| <b>Step 2</b> | (Optional)<br><br><b>description</b> <i>string</i><br><br><b>Example:</b><br>hostname(config-cmap)# description All UDP traffic | Adds a description to the class map.                                                                                                                                                                                                                                                                                                  |
| <b>Step 3</b> | Match traffic using one of the following:                                                                                       | Unless otherwise specified, you can include only one <b>match</b> command in the class map.                                                                                                                                                                                                                                           |
|               | <b>match any</b><br><br><b>Example:</b><br>hostname(config-cmap)# match any                                                     | Matches all traffic.<br><br><b>Note</b> For features that support IPv6 (see the <a href="#">“Guidelines and Limitations” section on page 32-6</a> ), then the <b>match any</b> and <b>match default-inspection-traffic</b> commands are the only commands that match IPv6 traffic. For example, you cannot match an IPv6 access list. |

| Command                                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>match default-inspection-traffic</b><br><br><b>Example:</b><br><pre>hostname(config-cmap)# match default-inspection-traffic</pre>                                                            | <p>Matches default traffic for inspection: the default TCP and UDP ports used by all applications that the ASA can inspect.</p> <p>This command, which is used in the default global policy, is a special CLI shortcut that when used in a policy map, ensures that the correct inspection is applied to each packet, based on the destination port of the traffic. For example, when UDP traffic for port 69 reaches the ASA, then the ASA applies the TFTP inspection; when TCP traffic for port 21 arrives, then the ASA applies the FTP inspection. So in this case only, you can configure multiple inspections for the same class map (with the exception of WAAS inspection, which can be configured with other inspections. See the <a href="#">“Incompatibility of Certain Feature Actions” section on page 32-5</a> for more information about combining actions). Normally, the ASA does not use the port number to determine the inspection applied, thus giving you the flexibility to apply inspections to non-standard ports, for example.</p> <p>See the <a href="#">“Default Settings” section on page 42-4</a> for a list of default ports. Not all applications whose ports are included in the <b>match default-inspection-traffic</b> command are enabled by default in the policy map.</p> <p>You can specify a <b>match access-list</b> command along with the <b>match default-inspection-traffic</b> command to narrow the matched traffic. Because the <b>match default-inspection-traffic</b> command specifies the ports and protocols to match, any ports and protocols in the access list are ignored.</p> <p><b>Tip</b> We suggest that you only inspect traffic on ports on which you expect application traffic; if you inspect all traffic, for example using <b>match any</b>, the ASA performance can be impacted.</p> <p><b>Note</b> For features that support IPv6 (see the <a href="#">“Guidelines and Limitations” section on page 32-6</a>), then the <b>match any</b> and <b>match default-inspection-traffic</b> commands are the only commands that match IPv6 traffic. For example, you cannot match an IPv6 access list.</p> |

| Command                                                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>match dscp</b> <i>value1</i> [ <i>value2</i> ] [...] [ <i>value8</i> ]<br><br><b>Example:</b><br>hostname(config-cmap)# match dscp af43 cs1 ef                                                                                          | Matches DSCP value in an IP header, up to eight DSCP values.                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>match precedence</b> <i>value1</i> [ <i>value2</i> ] [ <i>value3</i> ] [ <i>value4</i> ]<br><br><b>Example:</b><br>hostname(config-cmap)# match precedence 1 4                                                                          | Matches up to four precedence values, represented by the TOS byte in the IP header, where <i>value1</i> through <i>value4</i> can be 0 to 7, corresponding to the possible precedences.                                                                                                                                                                                                                                                                           |
| <b>match rtp</b> <i>starting_port</i> <i>range</i><br><br><b>Example:</b><br>hostname(config-cmap)# match rtp 4004 100                                                                                                                     | Matches RTP traffic, where the <i>starting_port</i> specifies an even-numbered UDP destination port between 2000 and 65534. The <i>range</i> specifies the number of additional UDP ports to match above the <i>starting_port</i> , between 0 and 16383.                                                                                                                                                                                                          |
| <b>match tunnel-group</b> <i>name</i><br><br>(Optional)<br><b>match flow ip destination-address</b><br><br><b>Example:</b><br>hostname(config-cmap)# match tunnel-group group1<br>hostname(config-cmap)# match flow ip destination-address | Matches VPN tunnel group traffic to which you want to apply QoS.<br><br>You can also specify one other <b>match</b> command to refine the traffic match. You can specify any of the preceding commands, except for the <b>match any</b> , <b>match access-list</b> , or <b>match default-inspection-traffic</b> commands. Or you can also enter the <b>match flow ip destination-address</b> command to match flows in the tunnel group going to each IP address. |

## Examples

The following is an example for the **class-map** command:

```
hostname(config)# access-list udp permit udp any any
hostname(config)# access-list tcp permit tcp any any
hostname(config)# access-list host_foo permit ip any 10.1.1.1 255.255.255.255

hostname(config)# class-map all_udp
hostname(config-cmap)# description "This class-map matches all UDP traffic"
hostname(config-cmap)# match access-list udp

hostname(config-cmap)# class-map all_tcp
hostname(config-cmap)# description "This class-map matches all TCP traffic"
hostname(config-cmap)# match access-list tcp

hostname(config-cmap)# class-map all_http
hostname(config-cmap)# description "This class-map matches all HTTP traffic"
hostname(config-cmap)# match port tcp eq http

hostname(config-cmap)# class-map to_server
hostname(config-cmap)# description "This class-map matches all traffic to server 10.1.1.1"
hostname(config-cmap)# match access-list host_foo
```

## Creating a Layer 3/4 Class Map for Management Traffic

For management traffic to the ASA, you might want to perform actions specific to this kind of traffic. You can specify a management class map that can match an access list or TCP or UDP ports. The types of actions available for a management class map in the policy map are specialized for management traffic. See the [“Supported Features for Management Traffic” section on page 32-2](#).

### Detailed Steps

|        | Command                                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                          |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>class-map type management</b> <i>class_map_name</i><br><br><b>Example:</b><br><pre>hostname(config)# class-map type management all_mgmt</pre>                                                | Creates a management class map, where <i>class_map_name</i> is a string up to 40 characters in length. The name “class-default” is reserved. All types of class maps use the same name space, so you cannot reuse a name already used by another type of class map. The CLI enters class-map configuration mode. |
| Step 2 | (Optional)<br><br><b>description</b> <i>string</i><br><br><b>Example:</b><br><pre>hostname(config-cmap)# description All management traffic</pre>                                               | Adds a description to the class map.                                                                                                                                                                                                                                                                             |
| Step 3 | Match traffic using one of the following:<br><br><b>match access-list</b> <i>access_list_name</i><br><br><b>Example:</b><br><pre>hostname(config-cmap)# match access-list udp</pre>             | Unless otherwise specified, you can include only one <b>match</b> command in the class map.<br><br>Matches traffic specified by an extended access list. If the ASA is operating in transparent firewall mode, you can use an EtherType access list.                                                             |
|        | <b>match port</b> { <b>tcp</b>   <b>udp</b> } { <b>eq</b> <i>port_num</i>   <b>range</b> <i>port_num port_num</i> }<br><br><b>Example:</b><br><pre>hostname(config-cmap)# match tcp eq 80</pre> | Matches TCP or UDP destination ports, either a single port or a contiguous range of ports.<br><br><b>Tip</b> For applications that use multiple, non-contiguous ports, use the <b>match access-list</b> command and define an ACE to match each port.                                                            |

## Defining Actions (Layer 3/4 Policy Map)

This section describes how to associate actions with Layer 3/4 class maps by creating a Layer 3/4 policy map.

### Restrictions

- The maximum number of policy maps is 64, but you can only apply one policy map per interface.
- If you modify a policy map while it is in use by the service policy, your changes do not take effect unless you delete and readd the policy map.

## Detailed Steps

|        | Command                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|-------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>policy-map</b> <i>policy_map_name</i><br><br><b>Example:</b><br>hostname(config)# policy-map global_policy                       | Adds the policy map. The <i>policy_map_name</i> argument is the name of the policy map up to 40 characters in length. All types of policy maps use the same name space, so you cannot reuse a name already used by another type of policy map. The CLI enters policy-map configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 2 | (Optional)<br><br><b>class</b> <i>class_map_name</i><br><br><b>Example:</b><br>hostname(config-pmap)# description global_policy map | Specifies a previously configured Layer 3/4 class map, where the <i>class_map_name</i> is the name of the class map. See the <a href="#">“Identifying Traffic (Layer 3/4 Class Maps)”</a> section on page 32-12 to add a class map.<br><br><b>Note</b> If there is no <b>match default-inspection-traffic</b> command in a class map, then at most one <b>inspect</b> command is allowed to be configured under the class.<br><br>For QoS, you can configure a hierarchical policy map for the traffic shaping and priority queue features. See the <a href="#">“Task Flow for Configuring Hierarchical Policy Maps for QoS Traffic Shaping”</a> section on page 32-11 for more information. |
| Step 3 | Specify one or more actions for this class map.                                                                                     | See the <a href="#">“Supported Features for Through Traffic”</a> section on page 32-2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 4 | Repeat <a href="#">Step 2</a> and <a href="#">Step 3</a> for each class map you want to include in this policy map.                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Examples

The following is an example of a **policy-map** command for connection policy. It limits the number of connections allowed to the web server 10.1.1.1:

```
hostname(config)# access-list http-server permit tcp any host 10.1.1.1
hostname(config)# class-map http-server
hostname(config-cmap)# match access-list http-server

hostname(config)# policy-map global-policy
hostname(config-pmap)# description This policy map defines a policy concerning connection to http server.
hostname(config-pmap)# class http-server
hostname(config-pmap-c)# set connection conn-max 256
```

The following example shows how multi-match works in a policy map:

```
hostname(config)# class-map inspection_default
hostname(config-cmap)# match default-inspection-traffic
hostname(config)# class-map http_traffic
hostname(config-cmap)# match port tcp eq 80

hostname(config)# policy-map outside_policy
hostname(config-pmap)# class inspection_default
hostname(config-pmap-c)# inspect http http_map
hostname(config-pmap-c)# inspect sip
hostname(config-pmap)# class http_traffic
hostname(config-pmap-c)# set connection timeout idle 0:10:0
```

The following example shows how traffic matches the first available class map, and will not match any subsequent class maps that specify actions in the same feature domain:

```
hostname(config)# class-map telnet_traffic
hostname(config-cmap)# match port tcp eq 23
hostname(config)# class-map ftp_traffic
hostname(config-cmap)# match port tcp eq 21
hostname(config)# class-map tcp_traffic
hostname(config-cmap)# match port tcp range 1 65535
hostname(config)# class-map udp_traffic
hostname(config-cmap)# match port udp range 0 65535
hostname(config)# policy-map global_policy
hostname(config-pmap)# class telnet_traffic
hostname(config-pmap-c)# set connection timeout idle 0:0:0
hostname(config-pmap-c)# set connection conn-max 100
hostname(config-pmap)# class ftp_traffic
hostname(config-pmap-c)# set connection timeout idle 0:5:0
hostname(config-pmap-c)# set connection conn-max 50
hostname(config-pmap)# class tcp_traffic
hostname(config-pmap-c)# set connection timeout idle 2:0:0
hostname(config-pmap-c)# set connection conn-max 2000
```

When a Telnet connection is initiated, it matches **class telnet\_traffic**. Similarly, if an FTP connection is initiated, it matches **class ftp\_traffic**. For any TCP connection other than Telnet and FTP, it will match **class tcp\_traffic**. Even though a Telnet or FTP connection can match **class tcp\_traffic**, the ASA does not make this match because they previously matched other classes.

## Applying Actions to an Interface (Service Policy)

To activate the Layer 3/4 policy map, create a service policy that applies it to one or more interfaces or that applies it globally to all interfaces.

### Restrictions

You can only apply one global policy, so if you want to alter the global policy, you need to either edit the default policy or disable it and apply a new one. By default, the configuration includes a global policy that matches all default application inspection traffic and applies inspection to the traffic globally. The default service policy includes the following command:

```
service-policy global_policy global
```

### Detailed Steps

| Command                                                                             | Purpose                                                                                     |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| <b>service-policy</b> <i>policy_map_name</i> <b>interface</b> <i>interface_name</i> | Creates a service policy by associating a policy map with an interface.                     |
| <b>service-policy</b> <i>policy_map_name</i> <b>global</b>                          | Creates a service policy that applies to all interfaces that do not have a specific policy. |

### Examples

For example, the following command enables the **inbound\_policy** policy map on the outside interface:

```
hostname(config)# service-policy inbound_policy interface outside
```

The following commands disable the default global policy, and enables a new one called `new_global_policy` on all other ASA interfaces:

```
hostname(config)# no service-policy global_policy global
hostname(config)# service-policy new_global_policy global
```

## Monitoring Modular Policy Framework

To monitor Modular Policy Framework, enter the following command:

| Command                          | Purpose                                 |
|----------------------------------|-----------------------------------------|
| <code>show service-policy</code> | Displays the service policy statistics. |

## Configuration Examples for Modular Policy Framework

This section includes several Modular Policy Framework examples and includes the following topics:

- [Applying Inspection and QoS Policing to HTTP Traffic, page 32-18](#)
- [Applying Inspection to HTTP Traffic Globally, page 32-19](#)
- [Applying Inspection and Connection Limits to HTTP Traffic to Specific Servers, page 32-20](#)
- [Applying Inspection to HTTP Traffic with NAT, page 32-21](#)

### Applying Inspection and QoS Policing to HTTP Traffic

In this example (see [Figure 32-1](#)), any HTTP connection (TCP traffic on port 80) that enters or exits the ASA through the outside interface is classified for HTTP inspection. Any HTTP traffic that exits the outside interface is classified for policing.

**Figure 32-1** HTTP Inspection and QoS Policing

See the following commands for this example:

```
hostname(config)# class-map http_traffic
hostname(config-cmap)# match port tcp eq 80

hostname(config)# policy-map http_traffic_policy
hostname(config-pmap)# class http_traffic
```

```
hostname(config-pmap-c)# inspect http
hostname(config-pmap-c)# police output 250000
hostname(config)# service-policy http_traffic_policy interface outside
```

## Applying Inspection to HTTP Traffic Globally

In this example (see [Figure 32-2](#)), any HTTP connection (TCP traffic on port 80) that enters the ASA through any interface is classified for HTTP inspection. Because the policy is a global policy, inspection occurs only as the traffic enters each interface.

**Figure 32-2** Global HTTP Inspection

See the following commands for this example:

```
hostname(config)# class-map http_traffic
hostname(config-cmap)# match port tcp eq 80

hostname(config)# policy-map http_traffic_policy
hostname(config-pmap)# class http_traffic
hostname(config-pmap-c)# inspect http
hostname(config)# service-policy http_traffic_policy global
```

## Applying Inspection and Connection Limits to HTTP Traffic to Specific Servers

In this example (see [Figure 32-3](#)), any HTTP connection destined for Server A (TCP traffic on port 80) that enters the ASA through the outside interface is classified for HTTP inspection and maximum connection limits. Connections initiated from Server A to Host A does not match the access list in the class map, so it is not affected.

Any HTTP connection destined for Server B that enters the ASA through the inside interface is classified for HTTP inspection. Connections initiated from Server B to Host B does not match the access list in the class map, so it is not affected.

**Figure 32-3** HTTP Inspection and Connection Limits to Specific Servers

See the following commands for this example:

```
hostname(config)# object network obj-192.168.1.2
hostname(config-network-object)# host 192.168.1.2
hostname(config-network-object)# nat (inside,outside) static 209.165.201.1
hostname(config)# object network obj-192.168.1.0
hostname(config-network-object)# subnet 192.168.1.0 255.255.255.0
hostname(config-network-object)# nat (inside,outside) dynamic 209.165.201.2
hostname(config)# access-list serverA extended permit tcp any host 209.165.201.1 eq 80
hostname(config)# access-list ServerB extended permit tcp any host 209.165.200.227 eq 80

hostname(config)# class-map http_serverA
hostname(config-cmap)# match access-list serverA
hostname(config)# class-map http_serverB
hostname(config-cmap)# match access-list serverB

hostname(config)# policy-map policy_serverA
hostname(config-pmap)# class http_serverA
hostname(config-pmap-c)# inspect http
hostname(config-pmap-c)# set connection conn-max 100
hostname(config)# policy-map policy_serverB
hostname(config-pmap)# class http_serverB
hostname(config-pmap-c)# inspect http

hostname(config)# service-policy policy_serverB interface inside
hostname(config)# service-policy policy_serverA interface outside
```

## Applying Inspection to HTTP Traffic with NAT

In this example, the Host on the inside network has two addresses: one is the real IP address 192.168.1.1, and the other is a mapped IP address used on the outside network, 209.165.200.225. Because the policy is applied to the inside interface, where the real address is used, then you must use the real IP address in the access list in the class map. If you applied it to the outside interface, you would use the mapped address.

**Figure 32-4 HTTP Inspection with NAT**

See the following commands for this example:

```
hostname(config)# static (inside,outside) 209.165.200.225 192.168.1.1
hostname(config)# access-list http_client extended permit tcp host 192.168.1.1 any eq 80

hostname(config)# class-map http_client
hostname(config-cmap)# match access-list http_client

hostname(config)# policy-map http_client
hostname(config-pmap)# class http_client
hostname(config-pmap-c)# inspect http

hostname(config)# service-policy http_client interface inside
```

## Feature History for Service Policies

Table 32-3 lists the release history for this feature.

**Table 32-3 Feature History for Service Policies**

| Feature Name                                                | Releases | Feature Information                                                                                                                                                                               |
|-------------------------------------------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Modular Policy Framework                                    | 7.0(1)   | Modular Policy Framework was introduced.                                                                                                                                                          |
| Management class map for use with RADIUS accounting traffic | 7.2(1)   | The management class map was introduced for use with RADIUS accounting traffic. The following commands were introduced: <b>class-map type management</b> , and <b>inspect radius-accounting</b> . |
| Inspection policy maps                                      | 7.2(1)   | The inspection policy map was introduced. The following command was introduced: <b>class-map type inspect</b> .                                                                                   |

**Table 32-3** *Feature History for Service Policies (continued)*

| Feature Name                                                         | Releases | Feature Information                                                                                                                                                                                                       |
|----------------------------------------------------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Regular expressions and policy maps                                  | 7.2(1)   | Regular expressions and policy maps were introduced to be used under inspection policy maps. The following commands were introduced: <b>class-map type regex</b> , <b>regex</b> , <b>match regex</b> .                    |
| Match any for inspection policy maps                                 | 8.0(2)   | The <b>match any</b> keyword was introduced for use with inspection policy maps: traffic can match one or more criteria to match the class map. Formerly, only <b>match all</b> was available.                            |
| Maximum connections and embryonic connections for management traffic | 8.0(2)   | The <b>set connection</b> command is now available for a Layer 3/4 management class map, for to-the-security appliance management traffic. Only the <b>conn-max</b> and <b>embryonic-conn-max</b> keywords are available. |

## CHAPTER 33

# Configuring Special Actions for Application Inspections (Inspection Policy Map)

Modular Policy Framework lets you configure special actions for many application inspections. When you enable an inspection engine in the Layer 3/4 policy map, you can also optionally enable actions as defined in an *inspection policy map*. When the inspection policy map matches traffic within the Layer 3/4 class map for which you have defined an inspection action, then that subset of traffic will be acted upon as specified (for example, dropped or rate-limited).

This chapter includes the following sections:

- [Information About Inspection Policy Maps, page 33-1](#)
- [Default Inspection Policy Maps, page 33-2](#)
- [Defining Actions in an Inspection Policy Map, page 33-2](#)
- [Identifying Traffic in an Inspection Class Map, page 33-5](#)
- [Where to Go Next, page 33-7](#)

## Information About Inspection Policy Maps

See the [“Configuring Application Layer Protocol Inspection” section on page 42-6](#) for a list of applications that support inspection policy maps.

An inspection policy map consists of one or more of the following elements. The exact options available for an inspection policy map depends on the application.

- Traffic matching command—You can define a traffic matching command directly in the inspection policy map to match application traffic to criteria specific to the application, such as a URL string, for which you then enable actions.
  - Some traffic matching commands can specify regular expressions to match text inside a packet. Be sure to create and test the regular expressions before you configure the policy map, either singly or grouped together in a regular expression class map.
- Inspection class map—(Not available for all applications. See the CLI help for a list of supported applications.) An inspection class map includes traffic matching commands that match application traffic with criteria specific to the application, such as a URL string. You then identify the class map in the policy map and enable actions. The difference between creating a class map and defining the traffic match directly in the inspection policy map is that you can create more complex match criteria and you can reuse class maps.

- Some traffic matching commands can specify regular expressions to match text inside a packet. Be sure to create and test the regular expressions before you configure the policy map, either singly or grouped together in a regular expression class map.
- Parameters—Parameters affect the behavior of the inspection engine.

## Default Inspection Policy Maps

The default inspection policy map configuration includes the following commands, which sets the maximum message length for DNS packets to be 512 bytes:

```
policy-map type inspect dns preset_dns_map
 parameters
 message-length maximum 512
```

### Note

There are other default inspection policy maps such as **policy-map type inspect esmtp \_default\_esmtp\_map**. These default policy maps are created implicitly by the command **inspect protocol**. For example, **inspect esmtp** implicitly uses the policy map “\_default\_esmtp\_map.” All the default policy maps can be shown by using the **show running-config all policy-map** command.

## Defining Actions in an Inspection Policy Map

When you enable an inspection engine in the Layer 3/4 policy map, you can also optionally enable actions as defined in an inspection policy map.

### Restrictions

You can specify multiple **class** or **match** commands in the policy map.

If a packet matches multiple different **match** or **class** commands, then the order in which the ASA applies the actions is determined by internal ASA rules, and not by the order they are added to the policy map. The internal rules are determined by the application type and the logical progression of parsing a packet, and are not user-configurable. For example for HTTP traffic, parsing a Request Method field precedes parsing the Header Host Length field; an action for the Request Method field occurs before the action for the Header Host Length field. For example, the following match commands can be entered in any order, but the **match request method get** command is matched first.

```
match request header host length gt 100
 reset
match request method get
 log
```

If an action drops a packet, then no further actions are performed in the inspection policy map. For example, if the first action is to reset the connection, then it will never match any further **match** or **class** commands. If the first action is to log the packet, then a second action, such as resetting the connection, can occur. (You can configure both the **reset** (or **drop-connection**, and so on.) and the **log** action for the same **match** or **class** command, in which case the packet is logged before it is reset for a given match.)

If a packet matches multiple **match** or **class** commands that are the same, then they are matched in the order they appear in the policy map. For example, for a packet with the header length of 1001, it will match the first command below, and be logged, and then will match the second command and be reset. If you reverse the order of the two **match** commands, then the packet will be dropped and the connection reset before it can match the second **match** command; it will never be logged.

```

match request header length gt 100
 log
match request header length gt 1000
 reset

```

A class map is determined to be the same type as another class map or **match** command based on the lowest priority **match** command in the class map (the priority is based on the internal rules). If a class map has the same type of lowest priority **match** command as another class map, then the class maps are matched according to the order they are added to the policy map. If the lowest priority command for each class map is different, then the class map with the higher priority **match** command is matched first. For example, the following three class maps contain two types of **match** commands: **match request-cmd** (higher priority) and **match filename** (lower priority). The ftp3 class map includes both commands, but it is ranked according to the lowest priority command, **match filename**. The ftp1 class map includes the highest priority command, so it is matched first, regardless of the order in the policy map. The ftp3 class map is ranked as being of the same priority as the ftp2 class map, which also contains the **match filename** command. They are matched according to the order in the policy map: ftp3 and then ftp2.

```

class-map type inspect ftp match-all ftp1
 match request-cmd get
class-map type inspect ftp match-all ftp2
 match filename regex abc
class-map type inspect ftp match-all ftp3
 match request-cmd get
 match filename regex abc

policy-map type inspect ftp ftp
 class ftp3
 log
 class ftp2
 log
 class ftp1
 log

```

## Detailed Steps

|        | Command                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | (Optional)<br>Create an inspection class map.                                                                                                                       | See the <a href="#">“Identifying Traffic in an Inspection Class Map”</a> section on page 33-5. Alternatively, you can identify the traffic directly within the policy map.                                                                                                                                                                                                                                                                                                         |
| Step 2 | <b>policy-map type inspect</b> <i>application</i><br><i>policy_map_name</i><br><br><b>Example:</b><br>hostname(config)# policy-map type inspect<br>http http_policy | Creates the inspection policy map. See the <a href="#">“Configuring Application Layer Protocol Inspection”</a> section on page 42-6 for a list of applications that support inspection policy maps.<br><br>The <i>policy_map_name</i> argument is the name of the policy map up to 40 characters in length. All types of policy maps use the same name space, so you cannot reuse a name already used by another type of policy map. The CLI enters policy-map configuration mode. |
| Step 3 | Specify the traffic on which you want to perform actions using one of the following methods:                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Command                                                                                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>class</b> <i>class_map_name</i><br><br><b>Example:</b><br><pre>hostname(config-pmap)# class http_traffic hostname(config-pmap-c)#</pre>                                                                                                                                | <p>Specifies the inspection class map that you created in the “Identifying Traffic in an Inspection Class Map” section on page 33-5.</p> <p>Not all applications support inspection class maps.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <p>Specify traffic directly in the policy map using one of the <b>match</b> commands described for each application in the inspection chapter.</p> <p><b>Example:</b></p> <pre>hostname(config-pmap)# match req-resp content-type mismatch hostname(config-pmap-c)#</pre> | <p>If you use a <b>match not</b> command, then any traffic that matches the criterion in the <b>match not</b> command does not have the action applied.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 4</b><br><br><pre>{[drop [send-protocol-error]   drop-connection [send-protocol-error]   mask   reset] [log]   rate-limit message_rate}</pre> <p><b>Example:</b></p> <pre>hostname(config-pmap-c)# drop-connection log</pre>                                      | <p>Specifies the action you want to perform on the matching traffic. Not all options are available for each application. Other actions specific to the application might also be available. See the appropriate inspection chapter for the exact options available.</p> <ul style="list-style-type: none"> <li>• <b>drop</b>—Drops all packets that match.</li> <li>• <b>send-protocol-error</b>—Sends a protocol error message.</li> <li>• <b>drop-connection</b>—Drops the packet and closes the connection.</li> <li>• <b>mask</b>—Masks out the matching portion of the packet.</li> <li>• <b>reset</b>—Drops the packet, closes the connection, and sends a TCP reset to the server and/or client.</li> <li>• <b>log</b>—Sends a system log message. You can use <b>log</b> alone or with one of the other keywords.</li> <li>• <b>rate-limit</b> <i>message_rate</i>—Limits the rate of messages.</li> </ul> |
| <b>Step 5</b><br><br><b>parameters</b><br><br><p><b>Example:</b></p> <pre>hostname(config-pmap)# parameters hostname(config-pmap-p)#</pre>                                                                                                                                | <p>Configures parameters that affect the inspection engine. The CLI enters parameters configuration mode. For the parameters available for each application, see the appropriate inspection chapter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Examples

The following is an example of an HTTP inspection policy map and the related class maps. This policy map is activated by the Layer 3/4 policy map, which is enabled by the service policy.

```
hostname(config)# regex url_example example\.com
hostname(config)# regex url_example2 example2\.com
hostname(config)# class-map type regex match-any URLs
hostname(config-cmap)# match regex url_example
hostname(config-cmap)# match regex url_example2

hostname(config-cmap)# class-map type inspect http match-all http-traffic
hostname(config-cmap)# match req-resp content-type mismatch
hostname(config-cmap)# match request body length gt 1000
hostname(config-cmap)# match not request uri regex class URLs
```

```
hostname(config-cmap)# policy-map type inspect http http-map1
hostname(config-pmap)# class http-traffic
hostname(config-pmap-c)# drop-connection log
hostname(config-pmap-c)# match req-resp content-type mismatch
hostname(config-pmap-c)# reset log
hostname(config-pmap-c)# parameters
hostname(config-pmap-p)# protocol-violation action log

hostname(config-pmap-p)# policy-map test
hostname(config-pmap)# class test (a Layer 3/4 class map not shown)
hostname(config-pmap-c)# inspect http http-map1

hostname(config-pmap-c)# service-policy test interface outside
```

## Identifying Traffic in an Inspection Class Map

This type of class map allows you to match criteria that is specific to an application. For example, for DNS traffic, you can match the domain name in a DNS query.

A class map groups multiple traffic matches (in a match-all class map), or lets you match any of a list of matches (in a match-any class map). The difference between creating a class map and defining the traffic match directly in the inspection policy map is that the class map lets you group multiple match commands, and you can reuse class maps. For the traffic that you identify in this class map, you can specify actions such as dropping, resetting, and/or logging the connection in the inspection policy map. If you want to perform different actions on different types of traffic, you should identify the traffic directly in the policy map.

### Restrictions

Not all applications support inspection class maps. See the CLI help for **class-map type inspect** for a list of supported applications.

## Detailed Steps

|        | Command                                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | (Optional)<br>Create a regular expression.                                                                                                                                                                                          | See the “ <a href="#">Creating a Regular Expression</a> ” section on page 13-12 and the “ <a href="#">Creating a Regular Expression Class Map</a> ” section on page 13-15.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 2 | <b>class-map type inspect</b> <i>application</i><br>[ <b>match-all</b>   <b>match-any</b> ] <i>class_map_name</i><br><br><b>Example:</b><br>hostname(config)# class-map type inspect<br>http http_traffic<br>hostname(config-cmap)# | Creates an inspection class map, where the <i>application</i> is the application you want to inspect. For supported applications, see the CLI help for a list of supported applications or see <a href="#">Chapter 42</a> , “ <a href="#">Getting Started with Application Layer Protocol Inspection</a> .”<br><br>The <i>class_map_name</i> argument is the name of the class map up to 40 characters in length.<br><br>The <b>match-all</b> keyword is the default, and specifies that traffic must match all criteria to match the class map.<br><br>The <b>match-any</b> keyword specifies that the traffic matches the class map if it matches at least one of the criteria.<br><br>The CLI enters class-map configuration mode, where you can enter one or more <b>match</b> commands. |
| Step 3 | (Optional)<br><br><b>description</b> <i>string</i><br><br><b>Example:</b><br>hostname(config-cmap)# description All UDP traffic                                                                                                     | Adds a description to the class map.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 4 | Define the traffic to include in the class by entering one or more <b>match</b> commands available for your application.                                                                                                            | To specify traffic that should not match the class map, use the <b>match not</b> command. For example, if the <b>match not</b> command specifies the string “example.com,” then any traffic that includes “example.com” does not match the class map.<br><br>To see the <b>match</b> commands available for each application, see the appropriate inspection chapter.                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Examples

The following example creates an HTTP class map that must match all criteria:

```
hostname(config-cmap)# class-map type inspect http match-all http-traffic
hostname(config-cmap)# match req-resp content-type mismatch
hostname(config-cmap)# match request body length gt 1000
hostname(config-cmap)# match not request uri regex class URLs
```

The following example creates an HTTP class map that can match any of the criteria:

```
hostname(config-cmap)# class-map type inspect http match-any monitor-http
hostname(config-cmap)# match request method get
hostname(config-cmap)# match request method put
hostname(config-cmap)# match request method post
```

## Where to Go Next

To use an inspection policy, see [Chapter 32, “Configuring a Service Policy Using the Modular Policy Framework.”](#)

## **PART 9**

### **Configuring Access Control**

# CHAPTER 34

## Configuring Access Rules

---

This chapter describes how to control network access through the ASA using access rules and includes the following sections:

- [Information About Access Rules, page 34-1](#)
- [Licensing Requirements for Access Rules, page 34-7](#)
- [Prerequisites, page 34-7](#)
- [Guidelines and Limitations, page 34-7](#)
- [Default Settings, page 34-8](#)
- [Configuring Access Rules, page 34-8](#)
- [Monitoring Access Rules, page 34-9](#)
- [Configuration Examples for Permitting or Denying Network Access, page 34-9](#)
- [Feature History for Access Rules, page 34-10](#)

### Note

You use access rules to control network access in both routed and transparent firewall modes. In transparent mode, you can use both access rules (for Layer 3 traffic) and EtherType rules (for Layer 2 traffic).

To access the ASA interface for management access, you do not also need an access rule allowing the host IP address. You only need to configure management access according to [Chapter 37, “Configuring Management Access.”](#)

---

## Information About Access Rules

You create an access rule by applying an extended or EtherType access list to an interface or globally for all interfaces. You can use access rules in routed and transparent firewall mode to control IP traffic. An access rule permits or denies traffic based on the protocol, a source and destination IP address or network, and optionally the source and destination ports.

### Note

To allow any traffic to enter the ASA, you must attach an inbound access rule to an interface; otherwise, the ASA automatically drops all traffic that enters that interface.

---

For transparent mode only, an EtherType rule controls network access for non-IP traffic. An EtherType rule permits or denies traffic based on the EtherType.

This section includes the following topics:

- [General Information About Rules, page 34-2](#)
- [Information About Extended Access Rules, page 34-5](#)
- [Information About EtherType Rules, page 34-6](#)

## General Information About Rules

This section describes information for both access rules and EtherType rules, and it includes the following topics:

- [Implicit Permits, page 34-2](#)
- [Using Access Rules and EtherType Rules on the Same Interface, page 34-2](#)
- [Using Remarks, page 34-3](#)
- [Inbound and Outbound Rules, page 34-3](#)
- [Using Global Access Rules, page 34-4](#)

### Implicit Permits

For routed mode, the following types of traffic are allowed through by default:

- IPv4 traffic from a higher security interface to a lower security interface.
- IPv6 traffic from a higher security interface to a lower security interface.

---

**Note** The above defaults might not be true if you have configured a global access rule.

---

For transparent mode, the following types of traffic are allowed through by default:

- IPv4 traffic from a higher security interface to a lower security interface.
- IPv6 traffic from a higher security interface to a lower security interface.
- ARPs in both directions.

---

**Note** ARP traffic can be controlled by ARP inspection, but cannot be controlled by an access rule.

---

- BPDUs in both directions.

For other traffic, you need to use either an extended access rule (IPv4), an IPv6 access rule (IPv6), or an EtherType rule (non-IPv4/IPv6).

### Using Access Rules and EtherType Rules on the Same Interface

You can apply one access rule and one EtherType rule to each direction of an interface.

## Using Remarks

In the ASDM access rule window, a remark that displays next to the rule is the one that was configured before the rule, so when you configure a remark from the CLI and then view it in an ASDM access rule window, the remark displays next to the rule that was configured after the remark in the CLI. However, the packet tracer in ASDM matches the remark that is configured after the matching rule in the CLI.

## Inbound and Outbound Rules

The ASA supports two types of access lists:

- Inbound—Inbound access lists apply to traffic as it enters an interface.
- Outbound—Outbound access lists apply to traffic as it exits an interface.

**Note**

“Inbound” and “outbound” refer to the application of an access list on an interface, either to traffic entering the ASA on an interface or traffic exiting the ASA on an interface. These terms do not refer to the movement of traffic from a lower security interface to a higher security interface, commonly known as inbound, or from a higher to lower interface, commonly known as outbound.

An inbound access list can bind an access list to a specific interface or apply a global rule on all interfaces. For more information about global rules, see the [“Using Global Access Rules” section on page 34-4](#).

An outbound access list is useful, for example, if you want to allow only certain hosts on the inside networks to access a web server on the outside network. Rather than creating multiple inbound access lists to restrict access, you can create a single outbound access list that allows only the specified hosts. (See [Figure 34-1](#).) The outbound access list prevents any other hosts from reaching the outside network.

**Figure 34-1 Outbound Access List**

See the following commands for this example:

```
hostname(config)# access-list OUTSIDE extended permit tcp host 209.165.201.4
host 209.165.200.225 eq www
hostname(config)# access-list OUTSIDE extended permit tcp host 209.165.201.6
host 209.165.200.225 eq www
hostname(config)# access-list OUTSIDE extended permit tcp host 209.165.201.8
host 209.165.200.225 eq www
hostname(config)# access-group OUTSIDE out interface outside
```

## Using Global Access Rules

Global access rules allow you to apply a global rule to ingress traffic without the need to specify an interface to which the rule must be applied. Using global access rules provides the following benefits:

- When migrating to the ASA from a competitor appliance, you can maintain a global access rule policy instead of needing to apply an interface-specific policy on each interface.
- Global access control policies are not replicated on each interface, so they save memory space.
- Global access rules provides flexibility in defining a security policy. You do not need to specify which interface a packet comes in on, as long as it matches the source and destination IP addresses.
- Global access rules use the same mtrie and stride tree as interface-specific access rules, so scalability and performance for global rules are the same as for interface-specific rules.

You can configure global access rules in conjunction with interface access rules, in which case, the specific interface access rules are always processed before the general global access rules.

## Information About Extended Access Rules

This section describes information about extended access rules and includes the following topics:

- [Access Rules for Returning Traffic](#), page 34-5
- [Allowing Broadcast and Multicast Traffic through the Transparent Firewall Using Access Rules](#), page 34-5
- [Management Access Rules](#), page 34-6

### Access Rules for Returning Traffic

For TCP and UDP connections for both routed and transparent mode, you do not need an access rule to allow returning traffic because the ASA allows all returning traffic for established, bidirectional connections.

For connectionless protocols such as ICMP, however, the ASA establishes unidirectional sessions, so you either need access rules to allow ICMP in both directions (by applying access lists to the source and destination interfaces), or you need to enable the ICMP inspection engine. The ICMP inspection engine treats ICMP sessions as bidirectional connections. To control ping, specify **echo-reply (0)** (ASA to host) or **echo (8)** (host to ASA).

### Allowing Broadcast and Multicast Traffic through the Transparent Firewall Using Access Rules

In routed firewall mode, broadcast and multicast traffic is blocked even if you allow it in an access rule, including unsupported dynamic routing protocols and DHCP (unless you configure DHCP relay). Transparent firewall mode can allow any IP traffic through. This feature is especially useful in multiple context mode, which does not allow dynamic routing, for example.

**Note**

Because these special types of traffic are connectionless, you need to apply an extended access list to both interfaces, so returning traffic is allowed through.

[Table 34-1](#) lists common traffic types that you can allow through the transparent firewall.

**Table 34-1**      *Transparent Firewall Special Traffic*

| Traffic Type      | Protocol or Port                                 | Notes                                                                                |
|-------------------|--------------------------------------------------|--------------------------------------------------------------------------------------|
| DHCP              | UDP ports 67 and 68                              | If you enable the DHCP server, then the ASA does not pass DHCP packets.              |
| EIGRP             | Protocol 88                                      | —                                                                                    |
| OSPF              | Protocol 89                                      | —                                                                                    |
| Multicast streams | The UDP ports vary depending on the application. | Multicast streams are always destined to a Class D address (224.0.0.0 to 239.x.x.x). |
| RIP (v1 or v2)    | UDP port 520                                     | —                                                                                    |

## Management Access Rules

You can configure access rules that control management traffic destined to the ASA. Access control rules for to-the-box management traffic (defined by such commands as **http**, **ssh**, or **telnet**) have higher precedence than an management access rule applied with the **control-plane** option. Therefore, such permitted management traffic will be allowed to come in even if explicitly denied by the to-the-box access list.

## Information About EtherType Rules

This section describes EtherType rules and includes the following topics:

- [Supported EtherTypes, page 34-6](#)
- [Access Rules for Returning Traffic, page 34-6](#)
- [Allowing MPLS, page 34-6](#)

### Supported EtherTypes

- An EtherType rule controls any EtherType identified by a 16-bit hexadecimal number.
- EtherType rules support Ethernet V2 frames.
- 802.3-formatted frames are not handled by the rule because they use a length field as opposed to a type field.
- BPDUs, which are permitted by default, are the only exception: they are SNAP-encapsulated, and the ASA is designed to specifically handle BPDUs.
- The ASA receives trunk port (Cisco proprietary) BPDUs. Trunk BPDUs have VLAN information inside the payload, so the ASA modifies the payload with the outgoing VLAN if you allow BPDUs.

### Access Rules for Returning Traffic

Because EtherTypes are connectionless, you need to apply the rule to both interfaces if you want traffic to pass in both directions.

### Allowing MPLS

If you allow MPLS, ensure that Label Distribution Protocol and Tag Distribution Protocol TCP connections are established through the ASA by configuring both MPLS routers connected to the ASA to use the IP address on the ASA interface as the router-id for LDP or TDP sessions. (LDP and TDP allow MPLS routers to negotiate the labels (addresses) used to forward packets.)

On Cisco IOS routers, enter the appropriate command for your protocol, LDP or TDP. The *interface* is the interface connected to the ASA.

```
hostname(config)# mpls ldp router-id interface force
```

Or

```
hostname(config)# tag-switching tdp router-id interface force
```

# Licensing Requirements for Access Rules

The following table shows the licensing requirements for this feature:

| Model      | License Requirement |
|------------|---------------------|
| All models | Base License.       |

## Prerequisites

Before you can create an access rule, create the access list. See [Chapter 15, “Adding an Extended Access List,”](#) and [Chapter 16, “Adding an EtherType Access List,”](#) for more information.

## Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

### Context Mode Guidelines

Supported in single and multiple context mode.

### Firewall Mode Guidelines

Supported in routed and transparent firewall modes.

### IPv6 Guidelines

Supports IPv6.

### Per-User Access List Guidelines

- If there is no per-user access list associated with a packet, the interface access rule is applied.
- The per-user access list uses the value in the **timeout uauth** command, but it can be overridden by the AAA per-user session timeout value.
- If traffic is denied because of a per-user access list, syslog message 109025 is logged. If traffic is permitted, no syslog message is generated. The **log** option in the per-user access list has no effect.

### Additional Guidelines and Limitations

- To access the ASA interface for management access, you do not need an access list allowing the host IP address. You only need to configure management access by following the instructions in [Chapter 37, “Configuring Management Access.”](#)
- In the ASDM access rule window, a remark that is displayed next to the rule is the one that was configured before the rule, so when you configure a remark from the CLI and then view it in an ASDM access rule window, the remark would be displayed next to the rule that was configured after the remark in the CLI. However, the packet tracer in ASDM matches the remark that is configured after the matching rule in the CLI.

# Default Settings

See the [“Implicit Permits” section on page 34-2](#).

# Configuring Access Rules

To apply an access rule, perform the following steps.

## Detailed Steps

| Command                                                                                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>access-group access_list {{in   out} interface interface_name [per-user-override   control-plane]   global}</pre> <p><b>Example:</b></p> <pre>hostname(config)# access-group acl_out in interface outside</pre> | <p>Binds an access list to an interface or applies it globally.</p> <p><b>Note</b> The <b>access-group</b> command cannot reference empty access lists or access lists that contain only a remark.</p> <p>The <b>in</b> keyword applies the access list to the traffic on the specified interface. The <b>out</b> keyword applies the access list to the outbound traffic.</p> <p>The <b>per-user-override</b> keyword (for inbound access lists only) allows dynamic user access lists that are downloaded for user authorization to override the access list assigned to the interface. For example, if the interface access list denies all traffic from 10.0.0.0, but the dynamic access list permits all traffic from 10.0.0.0, then the dynamic access list overrides the interface access list for that user. See the <a href="#">“Configuring RADIUS Authorization” section on page 38-14</a> for more information about per-user access lists. See also the <a href="#">“Per-User Access List Guidelines” section on page 34-7</a>.</p> <p>The <b>control-plane</b> keyword specifies if the rule is for to-the-box traffic.</p> <p>The <b>global</b> keyword applies the access list to the inbound direction of all interfaces.</p> |

## Examples

The following example shows how to use the **access-group** command:

```
hostname(config)# access-list acl_out permit tcp any host 209.165.201.3 eq 80
hostname(config)# access-group acl_out in interface outside
```

The **access-list** command lets any host access the global address using port 80. The **access-group** command specifies that the **access-list** command applies to traffic entering the outside interface.

# Monitoring Access Rules

To monitor network access, enter the following command:

| Command                                       | Purpose                                                   |
|-----------------------------------------------|-----------------------------------------------------------|
| <code>show running-config access-group</code> | Displays the current access list bound to the interfaces. |

## Configuration Examples for Permitting or Denying Network Access

This section includes typical configuration examples for permitting or denying network access.

The following example illustrates the commands required to enable access to an inside web server with the IP address 209.165.201.12. (This IP address is the real address, not the visible on the outside interface after NAT.)

```
hostname(config)# access-list ACL_OUT extended permit tcp any host 209.165.201.12 eq www
hostname(config)# access-group ACL_OUT in interface outside
```

The following example allows all hosts to communicate between the **inside** and **hr** networks but only specific hosts to access the outside network:

```
hostname(config)# access-list ANY extended permit ip any any
hostname(config)# access-list OUT extended permit ip host 209.168.200.3 any
hostname(config)# access-list OUT extended permit ip host 209.168.200.4 any

hostname(config)# access-group ANY in interface inside
hostname(config)# access-group ANY in interface hr
hostname(config)# access-group OUT out interface outside
```

For example, the following sample access list allows common EtherTypes originating on the inside interface:

```
hostname(config)# access-list ETHER ethertype permit ipx
hostname(config)# access-list ETHER ethertype permit mpls-unicast
hostname(config)# access-group ETHER in interface inside
```

The following example allows some EtherTypes through the ASA, but it denies all others:

```
hostname(config)# access-list ETHER ethertype permit 0x1234
hostname(config)# access-list ETHER ethertype permit mpls-unicast
hostname(config)# access-group ETHER in interface inside
hostname(config)# access-group ETHER in interface outside
```

The following example denies traffic with EtherType 0x1256 but allows all others on both interfaces:

```
hostname(config)# access-list nonIP ethertype deny 1256
hostname(config)# access-list nonIP ethertype permit any
hostname(config)# access-group ETHER in interface inside
hostname(config)# access-group ETHER in interface outside
```

The following example uses object groups to permit specific traffic on the inside interface:

```
!
hostname (config)# object-group service myaclog
hostname (config-service)# service-object tcp source range 2000 3000
```

```

hostname (config-service)# service-object tcp source range 3000 3010 destination$
hostname (config-service)# service-object ipsec
hostname (config-service)# service-object udp destination range 1002 1006
hostname (config-service)# service-object icmp echo

```

```

hostname(config)# access-list outsideacl extended permit object-group myaclog interface
inside any

```

## Feature History for Access Rules

Table 34-2 lists each feature change and the platform release in which it was implemented.

**Table 34-2**      *Feature History for Access Rules*

| Feature Name           | Platform Releases | Feature Information                                                                                                              |

| Interface access rules | 7.0(1)            | Controlling network access through the ASA using access lists.<br><br>We introduced the following command: <b>access-group</b> . |
| Global access rules    | 8.3(1)            | Global access rules were introduced.<br><br>We modified the following command: <b>access-group</b> .                             |

# CHAPTER 35

## Configuring AAA Servers and the Local Database

---

This chapter describes support for authentication, authorization, and accounting (AAA, pronounced “triple A”), and how to configure AAA servers and the local database.

The chapter includes the following sections:

- [Information About AAA, page 35-1](#)
- [Licensing Requirements for AAA Servers, page 35-10](#)
- [Guidelines and Limitations, page 35-10](#)
- [Configuring AAA, page 35-10](#)
- [Monitoring AAA Servers, page 35-26](#)
- [Additional References, page 35-27](#)
- [Feature History for AAA Servers, page 35-27](#)

### Information About AAA

AAA enables the ASA to determine who the user is (authentication), what the user can do (authorization), and what the user did (accounting).

AAA provides an extra level of protection and control for user access than using access lists alone. For example, you can create an access list allowing all outside users to access Telnet on a server on the DMZ network. If you want only some users to access the server and you might not always know IP addresses of these users, you can enable AAA to allow only authenticated and/or authorized users to connect through the ASA. (The Telnet server enforces authentication, too; the ASA prevents unauthorized users from attempting to access the server.)

You can use authentication alone or with authorization and accounting. Authorization always requires a user to be authenticated first. You can use accounting alone, or with authentication and authorization.

This section includes the following topics:

- [Information About Authentication, page 35-2](#)
- [Information About Authorization, page 35-2](#)
- [Information About Accounting, page 35-3](#)
- [Summary of Server Support, page 35-3](#)
- [RADIUS Server Support, page 35-4](#)
- [TACACS+ Server Support, page 35-5](#)

- [RSA/SDI Server Support, page 35-5](#)
- [NT Server Support, page 35-6](#)
- [Kerberos Server Support, page 35-6](#)
- [LDAP Server Support, page 35-6](#)
- [Local Database Support, Including as a Falback Method, page 35-8](#)
- [How Fallback Works with Multiple Servers in a Group, page 35-8](#)
- [Using Certificates and User Login Credentials, page 35-9](#)
- [Task Flow for Configuring AAA, page 35-11](#)

## Information About Authentication

Authentication controls access by requiring valid user credentials, which are usually a username and password. You can configure the ASA to authenticate the following items:

- All administrative connections to the ASA, including the following sessions:
  - Telnet
  - SSH
  - Serial console
  - ASDM using HTTPS
  - VPN management access
- The **enable** command
- Network access
- VPN access

## Information About Authorization

Authorization controls access *per user* after users are authenticated. You can configure the ASA to authorize the following items:

- Management commands
- Network access
- VPN access

Authorization controls the services and commands that are available to each authenticated user. If you did not enable authorization, authentication alone would provide the same access to services for all authenticated users.

If you need the control that authorization provides, you can configure a broad authentication rule, and then have a detailed authorization configuration. For example, you can authenticate inside users who try to access any server on the outside network and then limit the outside servers that a particular user can access using authorization.

The ASA caches the first 16 authorization requests per user, so if the user accesses the same services during the current authentication session, the ASA does not resend the request to the authorization server.

## Information About Accounting

Accounting tracks traffic that passes through the ASA, enabling you to have a record of user activity. If you enable authentication for that traffic, you can account for traffic per user. If you do not authenticate the traffic, you can account for traffic per IP address. Accounting information includes session start and stop times, username, the number of bytes that pass through the ASA for the session, the service used, and the duration of each session.

## Summary of Server Support

[Table 35-1](#) summarizes the support for each AAA service by each AAA server type, including the local database. For more information about support for a specific AAA server type, see the topics following the table.

**Table 35-1** Summary of AAA Support

| AAA Service                 | Database Type    |                  |         |                  |     |          |      |                  |
|-----------------------------|------------------|------------------|---------|------------------|-----|----------|------|------------------|
|                             | Local            | RADIUS           | TACACS+ | SDI (RSA)        | NT  | Kerberos | LDAP | HTTP Form        |
| <b>Authentication of...</b> |                  |                  |         |                  |     |          |      |                  |
| VPN users <sup>1</sup>      | Yes              | Yes              | Yes     | Yes              | Yes | Yes      | Yes  | Yes <sup>2</sup> |
| Firewall sessions           | Yes              | Yes              | Yes     | Yes              | Yes | Yes      | Yes  | No               |
| Administrators              | Yes              | Yes              | Yes     | Yes <sup>3</sup> | Yes | Yes      | Yes  | No               |
| <b>Authorization of...</b>  |                  |                  |         |                  |     |          |      |                  |
| VPN users                   | Yes              | Yes              | No      | No               | No  | No       | Yes  | No               |
| Firewall sessions           | No               | Yes <sup>4</sup> | Yes     | No               | No  | No       | No   | No               |
| Administrators              | Yes <sup>5</sup> | No               | Yes     | No               | No  | No       | No   | No               |
| <b>Accounting of...</b>     |                  |                  |         |                  |     |          |      |                  |
| VPN connections             | No               | Yes              | Yes     | No               | No  | No       | No   | No               |
| Firewall sessions           | No               | Yes              | Yes     | No               | No  | No       | No   | No               |
| Administrators              | No               | Yes <sup>6</sup> | Yes     | No               | No  | No       | No   | No               |

1. For SSL VPN connections, either PAP or MS-CHAPv2 can be used.
2. HTTP Form protocol supports both authentication and single sign-on operations for clientless SSL VPN users sessions only.
3. RSA/SDI is supported for ASDM HTTP administrative access with ASA 5500 software version 8.2(1) or later.
4. For firewall sessions, RADIUS authorization is supported with user-specific access lists only, which are received or specified in a RADIUS authentication response.
5. Local command authorization is supported by privilege level only.
6. Command accounting is available for TACACS+ only.

### Note

In addition to the native protocol authentication listed in [Table 35-1](#), the ASA supports proxying authentication. For example, the ASA can proxy to an RSA/SDI and/or LDAP server via a RADIUS server. Authentication via digital certificates and/or digital certificates with the AAA combinations listed in the table are also supported.

## RADIUS Server Support

The ASA supports the following RFC-compliant RADIUS servers for AAA:

- Cisco Secure ACS 3.2, 4.0, 4.1, 4.2, and 5.x
- Cisco Identity Services Engine (ISE)
- RSA RADIUS in RSA Authentication Manager 5.2, 6.1, and 7.x
- Microsoft

## Authentication Methods

The ASA supports the following authentication methods with RADIUS:

- PAP—For all connection types.
- CHAP and MS-CHAPv1—For L2TP-over-IPsec connections.
- MS-CHAPv2—For L2TP-over-IPsec connections, and for regular IPsec remote access connections when the password management feature is enabled. You can also use MS-CHAPv2 with clientless connections.
- Authentication Proxy modes—including RADIUS to Active Directory, RADIUS to RSA/SDI, RADIUS to Token-server, and RSA/SDI to RADIUS connections,

### Note

To enable MS-CHAPv2 as the protocol used between the ASA and the RADIUS server for a VPN connection, password management must be enabled in the tunnel group general attributes. Enabling password management generates an MS-CHAPv2 authentication request from the ASA to the RADIUS server. See the description of the **password-management** command for details.

If you use double authentication and enable password management in the tunnel group, then the primary and secondary authentication requests include MS-CHAPv2 request attributes. If a RADIUS server does not support MS-CHAPv2, then you can configure that server to send a non-MS-CHAPv2 authentication request by using the **no mschapv2-capable** command.

## Attribute Support

The ASA supports the following sets of RADIUS attributes:

- Authentication attributes defined in RFC 2138.
- Accounting attributes defined in RFC 2139.
- RADIUS attributes for tunneled protocol support, defined in RFC 2868.
- Cisco IOS Vendor-Specific Attributes (VSAs), identified by RADIUS vendor ID 9.
- Cisco VPN-related VSAs, identified by RADIUS vendor ID 3076.
- Microsoft VSAs, defined in RFC 2548.
- Cisco VSA (Cisco-Priv-Level), which provides a standard 0-15 numeric ranking of privileges, with 1 being the lowest level and 15 being the highest level. A zero level indicates no privileges. The first level (login) allows privileged EXEC access for the commands available at this level. The second level (enable) allows CLI configuration privileges.

- A list of attributes is available at the following URL:  
[http://www.cisco.com/en/US/docs/security/asa/asa84/configuration/guide/ref\\_extserver.html#wp1605508](http://www.cisco.com/en/US/docs/security/asa/asa84/configuration/guide/ref_extserver.html#wp1605508)

## RADIUS Authorization Functions

The ASA can use RADIUS servers for user authorization of VPN remote access and firewall cut-through-proxy sessions using dynamic access lists or access list names per user. To implement dynamic access lists, you must configure the RADIUS server to support it. When the user authenticates, the RADIUS server sends a downloadable access list or access list name to the ASA. Access to a given service is either permitted or denied by the access list. The ASA deletes the access list when the authentication session expires.

In addition to access lists, the ASA supports many other attributes for authorization and setting of permissions for VPN remote access and firewall cut-through proxy sessions. For a complete list of authorization attributes, see the following URL:

[http://www.cisco.com/en/US/docs/security/asa/asa84/configuration/guide/ref\\_extserver.html#wp1605508](http://www.cisco.com/en/US/docs/security/asa/asa84/configuration/guide/ref_extserver.html#wp1605508)

## TACACS+ Server Support

The ASA supports TACACS+ authentication with ASCII, PAP, CHAP, and MS-CHAPv1.

## RSA/SDI Server Support

The RSA SecureID servers are also known as SDI servers.

This section includes the following topics:

- [RSA/SDI Version Support, page 35-5](#)
- [Two-step Authentication Process, page 35-5](#)
- [RSA/SDI Primary and Replica Servers, page 35-6](#)

## RSA/SDI Version Support

The ASA supports SDI Versions 5.x, 6.x, and 7.x. SDI uses the concepts of an SDI primary and SDI replica servers. Each primary and its replicas share a single node secret file. The node secret file has its name based on the hexadecimal value of the ACE or Server IP address, with .sdi appended.

A version 5.x, 6.x, or 7.x SDI server that you configure on the ASA can be either the primary or any one of the replicas. See the [“RSA/SDI Primary and Replica Servers” section on page 35-6](#) for information about how the SDI agent selects servers to authenticate users.

## Two-step Authentication Process

SDI Versions 5.x, 6.x, or 7.x use a two-step process to prevent an intruder from capturing information from an RSA SecurID authentication request and using it to authenticate to another server. The agent first sends a lock request to the SecurID server before sending the user authentication request. The server

locks the username, preventing another (replica) server from accepting it. This action means that the same user cannot authenticate to two ASAs using the same authentication servers simultaneously. After a successful username lock, the ASA sends the passcode.

## RSA/SDI Primary and Replica Servers

The ASA obtains the server list when the first user authenticates to the configured server, which can be either a primary or a replica. The ASA then assigns priorities to each of the servers on the list, and subsequent server selection is derived at random from those assigned priorities. The highest priority servers have a higher likelihood of being selected.

## NT Server Support

The ASA supports Microsoft Windows server operating systems that support NTLM Version 1, collectively referred to as NT servers.

**Note**

NT servers have a maximum length of 14 characters for user passwords. Longer passwords are truncated, which is a limitation of NTLM Version 1.

## Kerberos Server Support

The ASA supports 3DES, DES, and RC4 encryption types.

**Note**

The ASA does not support changing user passwords during tunnel negotiation. To avoid this situation happening inadvertently, disable password expiration on the Kerberos/Active Directory server for users connecting to the ASA.

For a simple Kerberos server configuration example, see [Example 35-2 on page 35-16](#).

## LDAP Server Support

The ASA supports LDAP. This section includes the following topics:

- [Authentication with LDAP, page 35-6](#)
- [LDAP Server Types, page 35-7](#)

## Authentication with LDAP

During authentication, the ASA acts as a client proxy to the LDAP server for the user, and authenticates to the LDAP server in either plain text or by using the SASL protocol. By default, the ASA passes authentication parameters, usually a username and password, to the LDAP server in plain text.

The ASA supports the following SASL mechanisms, listed in order of increasing strength:

- Digest-MD5—The ASA responds to the LDAP server with an MD5 value computed from the username and password.

- Kerberos—The ASA responds to the LDAP server by sending the username and realm using the GSSAPI Kerberos mechanism.

You can configure the ASA and LDAP server to support any combination of these SASL mechanisms. If you configure multiple mechanisms, the ASA retrieves the list of SASL mechanisms that are configured on the server and sets the authentication mechanism to the strongest mechanism configured on both the ASA and the server. For example, if both the LDAP server and the ASA support both mechanisms, the ASA selects Kerberos, the stronger of the mechanisms.

When user LDAP authentication has succeeded, the LDAP server returns the attributes for the authenticated user. For VPN authentication, these attributes generally include authorization data that is applied to the VPN session. Thus, using LDAP accomplishes authentication and authorization in a single step.

## LDAP Server Types

The ASA supports LDAP version 3 and is compatible with the Sun Microsystems JAVA System Directory Server (formerly named the Sun ONE Directory Server), the Microsoft Active Directory, Novell, OpenLDAP, and other LDAPv3 directory servers.

By default, the ASA auto-detects whether it is connected to Microsoft Active Directory, Sun LDAP, Novell, OpenLDAP, or a generic LDAPv3 directory server. However, if auto-detection fails to determine the LDAP server type, and you know the server is either a Microsoft, Sun or generic LDAP server, you can manually configure the server type.

When configuring the server type, note the following guidelines:

- The DN configured on the ASA to access a Sun directory server must be able to access the default password policy on that server. We recommend using the directory administrator, or a user with directory administrator privileges, as the DN. Alternatively, you can place an ACL on the default password policy.
- You must configure LDAP over SSL to enable password management with Microsoft Active Directory and Sun servers.
- The ASA does not support password management with Novell, OpenLDAP, and other LDAPv3 directory servers.
- The ASA uses the Login Distinguished Name (DN) and Login Password to establish a trust relationship (bind) with an LDAP server. For more information, see the [“Binding the ASA to the LDAP Server” section on page C-4](#).

## HTTP Forms Authentication for Clientless SSL VPN

The ASA can use the HTTP Form protocol for both authentication and single sign-on (SSO) operations of Clientless SSL VPN user sessions only. For configuration information, see the [“Using Single Sign-on with Clientless SSL VPN”](#) section on page 73-13.

## Local Database Support, Including as a Falback Method

The ASA maintains a local database that you can populate with user profiles.

The local database can act as a fallback method for several functions. This behavior is designed to help you prevent accidental lockout from the ASA.

For users who need fallback support, we recommend that their usernames and passwords in the local database match their usernames and passwords on the AAA servers. This practice provides transparent fallback support. Because the user cannot determine whether a AAA server or the local database is providing the service, using usernames and passwords on AAA servers that are different than the usernames and passwords in the local database means that the user cannot be certain which username and password should be given.

The local database supports the following fallback functions:

- Console and enable password authentication—If the servers in the group are all unavailable, the ASA uses the local database to authenticate administrative access, which can also include enable password authentication.
- Command authorization—If the TACACS+ servers in the group are all unavailable, the local database is used to authorize commands based on privilege levels.
- VPN authentication and authorization—VPN authentication and authorization are supported to enable remote access to the ASA if AAA servers that normally support these VPN services are unavailable. When a VPN client of an administrator specifies a tunnel group configured to fallback to the local database, the VPN tunnel can be established even if the AAA server group is unavailable, provided that the local database is configured with the necessary attributes.

## How Fallback Works with Multiple Servers in a Group

If you configure multiple servers in a server group and you enable fallback to the local database for the server group, fallback occurs when no server in the group responds to the authentication request from the ASA. To illustrate, consider this scenario:

You configure an LDAP server group with two Active Directory servers, server 1 and server 2, in that order. When the remote user logs in, the ASA attempts to authenticate to server 1.

If server 1 responds with an authentication failure (such as *user not found*), the ASA does not attempt to authenticate to server 2.

If server 1 does not respond within the timeout period (or the number of authentication attempts exceeds the configured maximum), the ASA tries server 2.

If both servers in the group do not respond, and the ASA is configured to fall back to the local database, the ASA tries to authenticate to the local database.

## Using Certificates and User Login Credentials

The following section describes the different methods of using certificates and user login credentials (username and password) for authentication and authorization. These methods apply to IPsec, AnyConnect, and Clientless SSL VPN.

In all cases, LDAP authorization does not use the password as a credential. RADIUS authorization uses either a common password for all users or the username as a password.

This section includes the following topics:

- [Using User Login Credentials, page 35-9](#)
- [Using Certificates, page 35-9](#)

### Using User Login Credentials

The default method for authentication and authorization uses the user login credentials.

- Authentication
  - Enabled by the authentication server group setting in the tunnel group (also called ASDM Connection Profile)
  - Uses the username and password as credentials
- Authorization
  - Enabled by the authorization server group setting in the tunnel group (also called ASDM Connection Profile)
  - Uses the username as a credential

### Using Certificates

If user digital certificates are configured, the ASA first validates the certificate. It does not, however, use any of the DN fields from certificates as a username for the authentication.

If both authentication and authorization are enabled, the ASA uses the user login credentials for both user authentication and authorization.

- Authentication
  - Enabled by the authentication server group setting
  - Uses the username and password as credentials
- Authorization
  - Enabled by the authorization server group setting
  - Uses the username as a credential

If authentication is disabled and authorization is enabled, the ASA uses the primary DN field for authorization.

- Authentication
  - DISABLED (set to None) by the authentication server group setting
  - No credentials used
- Authorization
  - Enabled by the authorization server group setting

- Uses the username value of the certificate primary DN field as a credential

**Note**

If the primary DN field is not present in the certificate, the ASA uses the secondary DN field value as the username for the authorization request.

For example, consider a user certificate that includes the following Subject DN fields and values:

`Cn=anyuser,OU=sales;O=XYZCorporation;L=boston;S=mass;C=us;ea=anyuser@example.com`

If the Primary DN = EA (E-mail Address) and the Secondary DN = CN (Common Name), then the username used in the authorization request would be `anyuser@example.com`.

## Licensing Requirements for AAA Servers

| Model      | License Requirement |
|------------|---------------------|
| All models | Base License.       |

## Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

### Context Mode Guidelines

Supported in single and multiple context mode.

### Firewall Mode Guidelines

Supported in routed and transparent firewall mode.

### IPv6 Guidelines

Supports IPv6.

## Configuring AAA

This section includes the following topics:

- [Configuring AAA Server Groups, page 35-11](#)
- [Configuring Authorization with LDAP for VPN, page 35-16](#)
- [Configuring LDAP Attribute Maps, page 35-18](#)
- [Adding a User Account to the Local Database, page 35-20](#)
- [Differentiating User Roles Using AAA, page 35-24](#)

## Task Flow for Configuring AAA

- 
- |               |                                                                                                                                                                                                                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | Do one or both of the following: <ul style="list-style-type: none"><li>• Add a AAA server group. See the <a href="#">“Configuring AAA Server Groups”</a> section on page 35-11.</li><li>• Add a user to the local database. See the <a href="#">“Adding a User Account to the Local Database”</a> section on page 35-20.</li></ul> |
| <b>Step 2</b> | (Optional) Configure authorization from an LDAP server that is separate and distinct from the authentication mechanism. See the <a href="#">“Configuring Authorization with LDAP for VPN”</a> section on page 35-16.                                                                                                               |
| <b>Step 3</b> | For an LDAP server, configure LDAP attribute maps. See the <a href="#">“Configuring LDAP Attribute Maps”</a> section on page 35-18.                                                                                                                                                                                                |
| <b>Step 4</b> | (Optional) Distinguish between administrative and remote-access users when they authenticate. See the <a href="#">“Differentiating User Roles Using AAA”</a> section on page 35-24.                                                                                                                                                |
- 

## Configuring AAA Server Groups

If you want to use an external AAA server for authentication, authorization, or accounting, you must first create at least one AAA server group per AAA protocol and add one or more servers to each group. You identify AAA server groups by name. Each server group is specific to one type of server: Kerberos, LDAP, NT, RADIUS, SDI, or TACACS+.

### Guidelines

- You can have up to 100 server groups in single mode or 4 server groups per context in multiple mode.
- Each group can have up to 16 servers in single mode or 4 servers in multiple mode.
- When a user logs in, the servers are accessed one at a time, starting with the first server you specify in the configuration, until a server responds. If all servers in the group are unavailable, the ASA tries the local database if you configured it as a fallback method (management authentication and authorization only). If you do not have a fallback method, the ASA continues to try the AAA servers.

## Detailed Steps

|        | Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>aaa-server</b> <i>server_tag</i> <b>protocol</b> {<b>kerberos</b>   <b>ldap</b>   <b>nt</b>   <b>radius</b>   <b>sdi</b>   <b>tacacs+</b>}</p> <p><b>Example:</b></p> <pre>hostname(config)# aaa-server servergroup1 protocol ldap hostname(config-aaa-server-group)#  hostname(config)# aaa-server servergroup1 protocol radius hostname(config-aaa-server-group)# interim-accounting-update  hostname(config)# aaa-server servergroup1 protocol radius hostname(config-aaa-server-group)# ad-agent-mode</pre> | <p>Identifies the server group name and the protocol. For example, to use RADIUS to authenticate network access and TACACS+ to authenticate CLI access, you need to create at least two server groups, one for RADIUS servers and one for TACACS+ servers.</p> <p>You can have up to 100 server groups in single mode or 4 server groups per context in multiple mode. Each group can have up to 15 servers in single mode or 4 servers in multiple mode.</p> <p>When you enter the <b>aaa-server protocol</b> command, you enter <b>aaa-server</b> group configuration mode.</p> <p>The <b>interim-accounting-update</b> option enables multi-session accounting for clientless SSL and AnyConnect sessions. If you choose this option, interim accounting records are sent to the RADIUS server in addition to the start and stop records.</p> <p><b>Tip</b> Choose this option if users have trouble completing a VPN connection using clean access SSO, which might occur when making clientless or AnyConnect connections directly to the ASA.</p> <p>The <b>ad-agent-mode</b> option specifies the shared secret between the ASA and the AD agent, and indicates that a RADIUS server group includes AD agents that are not full-function RADIUS servers. Only a RADIUS server group that has been configured using the <b>ad-agent-mode</b> option can be associated with user identity. As a result, the <b>test aaa-server {authentication   authorization} aaa-server-group</b> command is not available when a RADIUS server group that is not configured using the <b>ad-agent-mode</b> option is specified.</p> |

|        | Command                                                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 2 | <b>merge-dacl</b> { <b>before-avpair</b>   <b>after-avpair</b> }<br><br><b>Example:</b><br><pre>hostname(config)# aaa-server servergroup1 protocol radius hostname(config-aaa-server-group)# merge-dacl before-avpair</pre> | <p>Merges a downloadable ACL with the ACL received in the Cisco AV pair from a RADIUS packet. The default setting is <b>no merge dacl</b>, which specifies that downloadable ACLs will not be merged with Cisco AV pair ACLs. If both an AV pair and a downloadable ACL are received, the AV pair has priority and is used.</p> <p>The <b>before-avpair</b> option specifies that the downloadable ACL entries should be placed before the Cisco AV pair entries.</p> <p>The <b>after-avpair</b> option specifies that the downloadable ACL entries should be placed after the Cisco AV pair entries. This option applies only to VPN connections. For VPN users, ACLs can be in the form of Cisco AV pair ACLs, downloadable ACLs, and an ACL that is configured on the ASA. This option determines whether or not the downloadable ACL and the AV pair ACL are merged, and does not apply to any ACLs configured on the ASA.</p>                                                                                                                                                                        |
| Step 3 | <b>max-failed-attempts</b> <i>number</i><br><br><b>Example:</b><br><pre>hostname(config-aaa-server-group)# max-failed-attempts 2</pre>                                                                                      | <p>Specifies the maximum number of requests sent to a AAA server in the group before trying the next server. The <i>number</i> argument can range from 1 and 5. The default is 3.</p> <p>If you configured a fallback method using the local database (for management access only; see the <a href="#">“Configuring Local Command Authorization”</a> section on page 37-24 and the <a href="#">“Configuring TACACS+ Command Authorization”</a> section on page 37-29 to configure the fallback mechanism), and all the servers in the group fail to respond, then the group is considered to be unresponsive, and the fallback method is tried. The server group remains marked as unresponsive for a period of 10 minutes (by default), so that additional AAA requests within that period do not attempt to contact the server group, and the fallback method is used immediately. To change the unresponsive period from the default, see the <b>reactivation-mode</b> command in the next step.</p> <p>If you do not have a fallback method, the ASA continues to retry the servers in the group.</p> |

|               | Command                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>reactivation-mode</b> { <b>depletion</b> [ <b>deadtime</b> <i>minutes</i> ]   <b>timed</b> }<br><br><b>Example:</b><br><pre>hostname(config-aaa-server-group)# reactivation-mode deadtime 20</pre> | <p>Specifies the method (reactivation policy) by which failed servers in a group are reactivated.</p> <p>The <b>depletion</b> keyword reactivates failed servers only after all of the servers in the group are inactive.</p> <p>The <b>deadtime</b> <i>minutes</i> keyword-argument pair specifies the amount of time in minutes, between 0 and 1440, that elapses between the disabling of the last server in the group and the subsequent reenabling of all servers. The default is 10 minutes.</p> <p>The <b>timed</b> keyword reactivates failed servers after 30 seconds of down time.</p>                                                                                                              |
| <b>Step 5</b> | <b>accounting-mode</b> <b>simultaneous</b><br><br><b>Example:</b><br><pre>hostname(config-aaa-server-group)# accounting-mode simultaneous</pre>                                                       | <p>Sends accounting messages to all servers in the group (RADIUS or TACACS+ only).</p> <p>To restore the default of sending messages only to the active server, enter the <b>accounting-mode single</b> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 6</b> | <b>aaa-server</b> <i>server_group</i> [ <i>interface_name</i> ] <b>host</b> <i>server_ip</i><br><br><b>Example:</b><br><pre>hostname(config)# aaa-server servergroup1 outside host 10.10.1.1</pre>    | <p>Identifies the server and the AAA server group to which it belongs.</p> <p>When you enter the <b>aaa-server host</b> command, you enter <b>aaa-server host</b> configuration mode. As needed, use host configuration mode commands to further configure the AAA server.</p> <p>The commands in host configuration mode do not apply to all AAA server types. <a href="#">Table 35-2</a> lists the available commands, the server types to which they apply, and whether or not a new AAA server definition has a default value for that command. Where a command is applicable to the specified server type and no default value is provided (indicated by “—”), use the command to specify the value.</p> |

Table 35-2 Host Mode Commands, Server Types, and Defaults

| Command                    | Applicable AAA Server Types | Default Value | Description |
|----------------------------|-----------------------------|---------------|-------------|
| <b>accounting-port</b>     | RADIUS                      | 1646          |             |
| <b>acl-netmask-convert</b> | RADIUS                      | standard      |             |
| <b>authentication-port</b> | RADIUS                      | 1645          |             |
| <b>kerberos-realm</b>      | Kerberos                    | —             |             |
| <b>key</b>                 | RADIUS                      | —             |             |
|                            | TACACS+                     | —             |             |
| <b>ldap-attribute-map</b>  | LDAP                        | —             |             |
| <b>ldap-base-dn</b>        | LDAP                        | —             |             |
| <b>ldap-login-dn</b>       | LDAP                        | —             |             |

**Table 35-2** Host Mode Commands, Server Types, and Defaults (continued)

| Command                          | Applicable AAA Server Types | Default Value  | Description                                                                                                                                                                                                                                                                |
|----------------------------------|-----------------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ldap-login-password</b>       | LDAP                        | —              |                                                                                                                                                                                                                                                                            |
| <b>ldap-naming-attribute</b>     | LDAP                        | —              |                                                                                                                                                                                                                                                                            |
| <b>ldap-over-ssl</b>             | LDAP                        | 636            | If not set, the ASA uses sAMAccountName for LDAP requests. Whether using SASL or plain text, you can secure communications between the ASA and the LDAP server with SSL. If you do not configure SASL, we strongly recommend that you secure LDAP communications with SSL. |

|                                  | SDI                         | 5500           |                                                                                                                                                                                                                                                                            |
|                                  | TACACS+                     | 49             |                                                                                                                                                                                                                                                                            |
| <b>server-type</b>               | LDAP                        | auto-discovery | If auto-detection fails to determine the LDAP server type, and you know the server is either a Microsoft, Sun or generic LDAP server, you can manually configure the server type.                                                                                          |
| <b>timeout</b>                   | All                         | 10 seconds     |                                                                                                                                                                                                                                                                            |

## Examples

[Example 35-1](#) shows how to add one TACACS+ group with one primary and one backup server, one RADIUS group with a single server, and an NT domain server.

### Example 35-1 Multiple AAA Server Groups and Servers

```
hostname(config)# aaa-server AuthInbound protocol tacacs+
hostname(config-aaa-server-group)# max-failed-attempts 2
hostname(config-aaa-server-group)# reactivation-mode depletion deadtime 20
hostname(config-aaa-server-group)# exit
hostname(config)# aaa-server AuthInbound (inside) host 10.1.1.1
hostname(config-aaa-server-host)# key TACPlusUauthKey
hostname(config-aaa-server-host)# exit
hostname(config)# aaa-server AuthInbound (inside) host 10.1.1.2
hostname(config-aaa-server-host)# key TACPlusUauthKey2
hostname(config-aaa-server-host)# exit
```

```

hostname(config)# aaa-server AuthOutbound protocol radius
hostname(config-aaa-server-group)# exit
hostname(config)# aaa-server AuthOutbound (inside) host 10.1.1.3
hostname(config-aaa-server-host)# key RadUauthKey
hostname(config-aaa-server-host)# exit
hostname(config)# aaa-server NTAAuth protocol nt
hostname(config-aaa-server-group)# exit
hostname(config)# aaa-server NTAAuth (inside) host 10.1.1.4
hostname(config-aaa-server-host)# nt-auth-domain-controller primary1
hostname(config-aaa-server-host)# exit

```

[Example 35-2](#) shows how to configure a Kerberos AAA server group named watchdogs, add a AAA server to the group, and define the Kerberos realm for the server. Because [Example 35-2](#) does not define a retry interval or the port that the Kerberos server listens to, the ASA uses the default values for these two server-specific parameters. [Table 35-2](#) lists the default values for all AAA server host mode commands.

**Note**

Kerberos realm names use numbers and upper-case letters only. Although the ASA accepts lower-case letters for a realm name, it does not translate lower-case letters to upper-case letters. Be sure to use upper-case letters only.

**Example 35-2 Kerberos Server Group and Server**

```

hostname(config)# aaa-server watchdogs protocol kerberos
hostname(config-aaa-server-group)# aaa-server watchdogs host 192.168.3.4
hostname(config-aaa-server-host)# kerberos-realm EXAMPLE.COM
hostname(config-aaa-server-host)# exit
hostname(config)#

```

## Configuring Authorization with LDAP for VPN

When user LDAP authentication for VPN access has succeeded, the ASA queries the LDAP server which returns LDAP attributes. These attributes generally include authorization data that applies to the VPN session. Thus, using LDAP accomplishes authentication and authorization in a single step.

There may be cases, however, where you require authorization from an LDAP directory server that is separate and distinct from the authentication mechanism. For example, if you use an SDI or certificate server for authentication, no authorization information is passed back. For user authorizations in this case, you can query an LDAP directory after successful authentication, accomplishing authentication and authorization in two steps.

To set up VPN user authorization using LDAP, perform the following steps.

### Detailed Steps

|               | Command                                                                                                                                                                                                                                                                  | Purpose                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>aaa-server</b> <i>server_group</i> <b>protocol</b> { <b>kerberos</b>   <b>ldap</b>   <b>nt</b>   <b>radius</b>   <b>sdi</b>   <b>tacacs+</b> }<br><br><b>Example:</b><br>hostname(config)# aaa-server servergroup1 protocol ldap<br>hostname(config-aaa-server-group) | Creates a AAA server group.                                                            |
| <b>Step 2</b> | <b>tunnel-group</b> <i>groupname</i><br><br><b>Example:</b><br>hostname(config)# tunnel-group remotegrp                                                                                                                                                                  | Creates an IPsec remote access tunnel group named remotegrp.                           |
| <b>Step 3</b> | <b>tunnel-group</b> <i>groupname</i> <b>general-attributes</b><br><br><b>Example:</b><br>hostname(config)# tunnel-group remotegrp general-attributes                                                                                                                     | Associates the server group and the tunnel group.                                      |
| <b>Step 4</b> | <b>authorization-server-group</b> <i>group-tag</i><br><br><b>Example:</b><br>hostname(config-general)# authorization-server-group ldap_dir_1                                                                                                                             | Assigns a new tunnel group to a previously created AAA server group for authorization. |

### Examples

While there are other authorization-related commands and options available for specific requirements, the following example shows commands for enabling user authorization with LDAP. The example then creates an IPsec remote access tunnel group named remote-1, and assigns that new tunnel group to the previously created ldap\_dir\_1 AAA server group for authorization:

```
hostname(config)# tunnel-group remote-1 type ipsec-ra
hostname(config)# tunnel-group remote-1 general-attributes
hostname(config-general)# authorization-server-group ldap_dir_1
hostname(config-general)#
```

After you complete this configuration work, you can then configure additional LDAP authorization parameters such as a directory password, a starting point for searching a directory, and the scope of a directory search by entering the following commands:

```
hostname(config)# aaa-server ldap_dir_1 protocol ldap
hostname(config-aaa-server-group)# aaa-server ldap_dir_1 host 10.1.1.4
hostname(config-aaa-server-host)# ldap-login-dn obscurepassword
hostname(config-aaa-server-host)# ldap-base-dn starthere
hostname(config-aaa-server-host)# ldap-scope subtree
hostname(config-aaa-server-host)#
```

## Configuring LDAP Attribute Maps

The ASA can use an LDAP directory for authenticating VPN remote access users or firewall network access/cut-thru-proxy sessions and/or for setting policy permissions (also called authorization attributes), such as ACLs, bookmark lists, DNS or WINS settings, session timers, and so on. That is, you can set the key attributes that exist in a local group policy externally through an LDAP server.

The authorization process is accomplished by means of LDAP attribute maps (similar to a RADIUS dictionary that defines vendor-specific attributes), which translate the native LDAP user attributes to Cisco ASA attribute names. You can then bind these attribute maps to LDAP servers or remove them, as needed. You can also show or clear attribute maps.

### Guidelines

To use the attribute mapping features correctly, you need to understand Cisco LDAP attribute names and values, as well as the user-defined attribute names and values. For more information about LDAP attribute maps, see the [“Active Directory/LDAP VPN Remote Access Authorization Examples” section on page C-15](#).

The names of frequently mapped Cisco LDAP attributes and the type of user-defined attributes that they would commonly be mapped to include the following:

- IETF-Radius-Class (Group\_Policy in ASA version 8.2 and later)—Sets the group policy based on the directory’s department or user group (for example, Microsoft Active Directory memberOf) attribute value. The group-policy attribute replaced the IETF-Radius-Class attribute with ASDM version 6.2/ASA version 8.2 or later.
- IETF-Radius-Filter-Id—An access control list or ACL applied to VPN clients, IPsec, and SSL.
- IETF-Radius-Framed-IP-Address—Assigns a static IP address assigned to a VPN remote access client, IPsec, and SSL.
- Banner1—Displays a text banner when the VPN remote access user logs in.
- Tunneling-Protocols—Allows or denies the VPN remote access session based on the access type.

---

**Note** A single ldapattribute map may contain one or many attributes. You can only assign one ldap attribute to a specific LDAP server.

---

To map LDAP features correctly, perform the following steps:

## Detailed Steps

|        | Command                                                                                                                                                                              | Purpose                                                                                                       |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>ldap attribute-map</b> <i>map-name</i><br><br><b>Example:</b><br>hostname(config)# ldap attribute-map<br>att_map_1                                                                | Creates an unpopulated LDAP attribute map table.                                                              |
| Step 2 | <b>map-name</b> <i>user-attribute-name</i><br><i>Cisco-attribute-name</i><br><br><b>Example:</b><br>hostname(config-ldap-attribute-map)#<br>map-name department IETF-Radius-Class    | Maps the user-defined attribute name department to the Cisco attribute.                                       |
| Step 3 | <b>map-value</b> <i>user-attribute-name</i><br><i>Cisco-attribute-name</i><br><br><b>Example:</b><br>hostname(config-ldap-attribute-map)#<br>map-value department Engineering group1 | Maps the user-defined map value department to the user-defined attribute value and the Cisco attribute value. |
| Step 4 | <b>aaa-server</b> <i>server_group</i> [ <i>interface_name</i> ]<br><b>host</b> <i>server_ip</i><br><br><b>Example:</b><br>hostname(config)# aaa-server ldap_dir_1<br>host 10.1.1.4   | Identifies the server and the AAA server group to which it belongs.                                           |
| Step 5 | <b>ldap-attribute-map</b> <i>map-name</i><br><br><b>Example:</b><br>hostname(config-aaa-server-host)#<br>ldap-attribute-map att_map_1                                                | Binds the attribute map to the LDAP server.                                                                   |

## Examples

The following example shows how to limit management sessions to the ASA based on an LDAP attribute called `accessType`. The `accessType` attribute has three possible values:

- VPN
- admin
- helpdesk

The following example shows how each value is mapped to one of the valid IETF-Radius-Service-Type attributes that the ASA supports: remote-access (Service-Type 5) Outbound, admin (Service-Type 6) Administrative, and nas-prompt (Service-Type 7) NAS Prompt:

```
hostname(config)# ldap attribute-map MGMT
hostname(config-ldap-attribute-map)# map-name accessType IETF-Radius-Service-Type
hostname(config-ldap-attribute-map)# map-value accessType VPN 5
hostname(config-ldap-attribute-map)# map-value accessType admin 6
hostname(config-ldap-attribute-map)# map-value accessType helpdesk 7

hostname(config-ldap-attribute-map)# aaa-server LDAP protocol ldap
```

```

hostname(config-aaa-server-group)# aaa-server LDAP (inside) host 10.1.254.91
hostname(config-aaa-server-host)# ldap-base-dn CN=Users,DC=cisco,DC=local
hostname(config-aaa-server-host)# ldap-scope subtree
hostname(config-aaa-server-host)# ldap-login-password test
hostname(config-aaa-server-host)# ldap-login-dn
CN=Administrator,CN=Users,DC=cisco,DC=local
hostname(config-aaa-server-host)# server-type auto-detect
hostname(config-aaa-server-host)# ldap-attribute-map MGMT

```

The following example shows how to display the complete list of Cisco LDAP attribute names:

```

hostname(config)# ldap attribute-map att_map_1
hostname(config-ldap-attribute-map)# map-name att_map_1?

ldap mode commands/options:
cisco-attribute-names:
 Access-Hours
 Allow-Network-Extension-Mode
 Auth-Service-Type
 Authenticated-User-Idle-Timeout
 Authorization-Required
 Authorization-Type
 :
 :
 X509-Cert-Data
hostname(config-ldap-attribute-map)#

```

## Adding a User Account to the Local Database

This section describes how to manage users in the local database.

To add a user to the local database, perform the following steps:

### Guidelines

The local database is used for the following features:

- ASDM per-user access
- Console authentication
- Telnet and SSH authentication.
- **enable** command authentication

This setting is for CLI-access only and does not affect the ASDM login.

- Command authorization

If you turn on command authorization using the local database, then the ASA refers to the user privilege level to determine which commands are available. Otherwise, the privilege level is not generally used. By default, all commands are either privilege level 0 or level 15.

- Network access authentication
- VPN client authentication

For multiple context mode, you can configure usernames in the system execution space to provide individual logins at the CLI using the **login** command; however, you cannot configure any AAA rules that use the local database in the system execution space.

## Limitations

You cannot use the local database for network access authorization.

## Detailed Steps

|        | Command                                                                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><b>username</b> <i>username</i> {<b>nopassword</b>   <b>password</b> <i>password</i> [<b>mschap</b>] } [<b>privilege</b> <i>priv_level</i>]</p> <p><b>Example:</b><br/> hostname(config)# username exampleuser1 privilege 1</p> | <p>Creates the user account. The <b>username</b> <i>username</i> keyword is a string from 4 to 64 characters long.</p> <p>The <b>password</b> <i>password</i> argument is a string from 3 to 32 characters long. The <b>mschap</b> keyword specifies that the password is converted to Unicode and hashed using MD4 after you enter it. Use this keyword if users are authenticated using MS-CHAPv1 or MS-CHAPv2. The <b>privilege</b> <i>level</i> argument sets the privilege level, which ranges from 0 to 15. The default is 2. This privilege level is used with command authorization.</p> <div style="border: 1px solid black; padding: 5px; margin-top: 10px;">  <p><b>Caution</b> If you do not use command authorization (the <b>aaa authorization console LOCAL</b> command), then the default level 2 allows management access to privileged EXEC mode. If you want to limit access to privileged EXEC mode, either set the privilege level to 0 or 1, or use the <b>service-type</b> command (see <a href="#">Step 5</a>).</p> </div> <p>The <b>nopassword</b> keyword creates a user account with no password.</p> <p>The <b>encrypted</b> and <b>nt-encrypted</b> keywords are typically for display only. When you define a password in the <b>username</b> command, the ASA encrypts it when it saves it to the configuration for security purposes. When you enter the <b>show running-config</b> command, the <b>username</b> command does not show the actual password; it shows the encrypted password followed by the <b>encrypted</b> or <b>nt-encrypted</b> keyword (when you specify <b>mschap</b>). For example, if you enter the password “test,” the <b>show running-config</b> output would appear as something similar to the following:</p> <pre>username user1 password DLaUiAX3l78qgoB5c7iVNw== nt-encrypted</pre> <p>The only time you would actually enter the <b>encrypted</b> or <b>nt-encrypted</b> keyword at the CLI is if you are cutting and pasting a configuration file for use in another ASA, and you are using the same password.</p> |

|        | Command                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 2 | <b>aaa authorization exec authentication-server</b><br><br><b>Example:</b><br><pre>hostname(config)# aaa authorization exec authentication-server</pre> | <p>(Optional) Enforces user-specific access levels for users who authenticate for management access (see the <b>aaa authentication console LOCAL</b> command). This command enables management authorization for local, RADIUS, LDAP (mapped), and TACACS+ users.</p> <p>Use the <b>aaa authorization exec LOCAL</b> command to enable attributes to be taken from the local database. See the <a href="#">“Limiting User CLI and ASDM Access with Management Authorization”</a> section on page 37-21 for information about configuring a user on a AAA server to accommodate management authorization.</p> <p>See the following prerequisites for each user type:</p> <ul style="list-style-type: none"> <li>• Configure local database users at a privilege level from 0 to 15 using the <b>username</b> command. Configure the level of access using the <b>service-type</b> command.</li> <li>• Configure RADIUS users with Cisco VSA CVPN3000-Privilege-Level with a value between 0 and 15.</li> <li>• Configure LDAP users with a privilege level between 0 and 15, and then map the LDAP attribute to Cisco VAS CVPN3000-Privilege-Level using the <b>ldap map-attributes</b> command.</li> <li>• See the <b>privilege</b> command for information about setting command privilege levels.</li> </ul> |
| Step 3 | <b>username username attributes</b><br><br><b>Example:</b><br><pre>hostname(config)# username exampleuser1 attributes</pre>                             | <p>(Optional) Configures username attributes. The <i>username</i> argument is the username that you created in <a href="#">Step 1</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|        | Command                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <b>service-type</b> { <b>admin</b>   <b>nas-prompt</b>   <b>remote-access</b> }<br><br><b>Example:</b><br>hostname(config-username)# <b>service-type admin</b> | <p>(Optional) Configures the user level if you configured management authorization in <a href="#">Step 2</a>. The <b>admin</b> keyword allows full access to any services specified by the <b>aaa authentication console LOCAL</b> commands. The <b>admin</b> keyword is the default.</p> <p>The <b>nas-prompt</b> keyword allows access to the CLI when you configure the <b>aaa authentication {telnet   ssh   serial} console LOCAL</b> command, but denies ASDM configuration access if you configure the <b>aaa authentication http console LOCAL</b> command. ASDM monitoring access is allowed. If you enable authentication with the <b>aaa authentication enable console LOCAL</b> command, the user cannot access privileged EXEC mode using the <b>enable</b> command (or the <b>login</b> command).</p> <p>The <b>remote-access</b> keyword denies management access. The user cannot use any services specified by the <b>aaa authentication console LOCAL</b> commands (excluding the <b>serial</b> keyword; serial access is allowed).</p> <p>(Optional) If you are using this username for VPN authentication, you can configure many VPN attributes for the user. For more information, see the “<a href="#">Configuring Attributes for Specific Users</a>” section on page 66-79.</p> |

## Examples

The following example assigns a privilege level of 15 to the admin user account:

```
hostname(config)# username admin password password privilege 15
```

The following example creates a user account with no password:

```
hostname(config)# username user34 nopassword
```

The following example enables management authorization, creates a user account with a password, enters username attributes configuration mode, and specifies the **service-type** attribute:

```
hostname(config)# aaa authorization exec authentication-server
hostname(config)# username user1 password g0ge0us
hostname(config)# username user1 attributes
hostname(config-username)# service-type nas-prompt
```

## Differentiating User Roles Using AAA

The ASA enables you to distinguish between administrative and remote-access users when they authenticate using RADIUS, LDAP, TACACS+, or the local user database. User role differentiation can prevent remote access VPN and network access users from establishing an administrative connection to the ASA.

To differentiate user roles, use the **service-type** attribute in username configuration mode. For RADIUS and LDAP (with the **ldap-attribute-map** command), you can use a Cisco Vendor-Specific Attribute (VSA), Cisco-Priv-Level, to assign a privilege level to an authenticated user.

This section includes the following topics:

- [Using Local Authentication, page 35-24](#)
- [Using RADIUS Authentication, page 35-25](#)
- [Using LDAP Authentication, page 35-25](#)
- [Using TACACS+ Authentication, page 35-26](#)

### Using Local Authentication

Before you configure the **service-type** attribute and privilege level when using local authentication, you must create a user, assign a password, and assign a privilege level. To do so, enter the following command:

```
hostname(config)# username admin password mysecret123 privilege 15
```

Where **mysecret123** is the stored password and 15 is the assigned privilege level, which indicates an admin user.

The available configuration options for the **service-type** attribute include the following:

- **admin**, in which users are allowed access to the configuration mode. This option also allows a user to connect via remote access.
- **nas-prompt**, in which users are allowed access to the EXEC mode.
- **remote-access**, in which users are allowed access to the network.

The following example designates a **service-type** of **admin** for a user named admin:

```
hostname(config)# username admin attributes
hostname(config-username)# service-type admin
```

The following example designates a **service-type** of **remote-access** for a user named ra-user:

```
hostname(config)# username ra-user attributes
hostname(config-username)# service-type remote-access
```

## Using RADIUS Authentication

The RADIUS IETF **service-type** attribute, when sent in an access-accept message as the result of a RADIUS authentication and authorization request, is used to designate which type of service is granted to the authenticated user. The supported attribute values are the following: administrative(6), nas-prompt(7), Framed(2), and Login(1). For a list of supported RADIUS IETF VSAs used for authentication and authorization, see [Table C-8 on page C-35](#).

For more information about using RADIUS authentication, see [“Configuring an External RADIUS Server” section on page C-25](#). For more information about configuring RADIUS authentication for Cisco Secure ACS, see the Cisco Secure ACS documentation on Cisco.com.

The RADIUS Cisco VSA **privilege-level** attribute (Vendor ID 3076, sub-ID 220), when sent in an access-accept message, is used to designate the level of privilege for the user. For a list of supported RADIUS VSAs used for authorization, see [Table C-7 on page C-27](#).

## Using LDAP Authentication

When users are authenticated through LDAP, the native LDAP attributes and their values can be mapped to Cisco ASA attributes to provide specific authorization features. For the supported list of LDAP VSAs used for authorization, see [Table C-2 on page C-5](#).

You can use the LDAP attribute mapping feature for LDAP authorization. For examples of this feature, see the [“Understanding Policy Enforcement of Permissions and Attributes” section on page C-1](#).

The following example shows how to define an LDAP attribute map. In this example, the security policy specifies that users being authenticated through LDAP map the user record fields or parameters title and company to the IETF-RADIUS service-type and privilege-level, respectively.

To define an LDAP attribute map, enter the following commands:

```
hostname(config)# ldap attribute-map admin-control
hostname(config-ldap-attribute-map)# map-name title IETF-RADIUS-Service-Type
hostname(config-ldap-attribute-map)# map-name company Privilege-Level
```

The following is sample output from the **ldap-attribute-map** command:

```
ldap attribute-map admin-control
 map-name company Privilege-Level
 map-name title IETF-Radius-Service-Type
```

To apply the LDAP attribute map to the LDAP AAA server, enter the following commands:

```
hostname(config)# aaa-server ldap-server (dmz1) host 10.20.30.1
hostname(config-aaa-server-host)# ldap-attribute-map admin-control
```

### Note

When an authenticated user tries administrative access to the ASA through ASDM, SSH, or Telnet, but does not have the appropriate privilege level to do so, the ASA generates syslog message 113021. This message informs the user that the attempted login failed because of inappropriate administrative privileges.

## Using TACACS+ Authentication

For information about how to configure TACACS+ authentication, see the [“Configuring an External TACACS+ Server” section on page C-36](#).

## Monitoring AAA Servers

To monitor AAA servers, enter one of the following commands:

| Command                                                 | Purpose                                                                                                                                                                                      |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>show aaa-server</code>                            | Shows the configured AAA server statistics.<br>To clear the AAA server configuration, enter the <b>clear aaa-server statistics</b> command.                                                  |
| <code>show running-config aaa-server</code>             | Shows the AAA server running configuration.<br>To clear AAA server statistics, enter the <b>clear configure aaa-server</b> command.                                                          |
| <code>show running-config all ldap attribute-map</code> | Shows all LDAP attribute maps in the running configuration.<br>To clear all LDAP attribute maps in the running configuration, use the <b>clear configuration ldap attribute-map</b> command. |
| <code>show running-config zonelabs-integrity</code>     | Shows the Zone Labs Integrity server configuration.<br>To clear the Zone Labs Integrity server configuration, use the <b>clear configure zonelabs-integrity</b> command.                     |
| <code>show ad-groups name [filter string]</code>        | Applies only to AD servers using LDAP, and shows groups that are listed on an AD server.                                                                                                     |

## Additional References

For additional information related to implementing LDAP mapping, see the [“RFCs” section on page 35-27](#).

| AAA Servers                                                                                                     | 7.0(1)            | <p>AAA Servers describe support for AAA and how to configure AAA servers and the local database.</p> <p>We introduced the following commands:</p> <p><b>username, aaa authorization exec authentication-server, aaa authentication console LOCAL, aaa authorization exec LOCAL, service-type, ldap attribute-map, aaa-server protocol, aaa authentication {telnet   ssh   serial} console LOCAL, aaa authentication http console LOCAL, aaa authentication enable console LOCAL, max-failed-attempts, reactivation-mode, accounting-mode simultaneous, aaa-server host, authorization-server-group, tunnel-group, tunnel-group general-attributes, map-name, map-value, ldap-attribute-map, zonelabs-Integrity server-address, zonelabs-integrity port, zonelabs-integrity interface, zonelabs-integrity fail-timeout, zonelabs-integrity fail-close, zonelabs-integrity fail-open, zonelabs-integrity ssl-certificate-port, zonelabs-integrity ssl-client-authentication {enable   disable}, client-firewall {opt   req} zonelabs-integrity</b></p> |
| Key vendor-specific attributes (VSAs) sent in RADIUS access request and accounting request packets from the ASA | 8.4(3)            | <p>Four New VSAs—Tunnel Group Name (146) and Client Type (150) are sent in RADIUS access request packets from the ASA. Session Type (151) and Session Subtype (152) are sent in RADIUS accounting request packets from the ASA. All four attributes are sent for all accounting request packet types: Start, Interim-Update, and Stop. The RADIUS server (for example, ACS and ISE) can then enforce authorization and policy attributes or use them for accounting and billing purposes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## CHAPTER 36

# Configuring the Identity Firewall

---

This chapter describes how to configure the ASA for the Identity Firewall. The chapter includes the following sections:

- [Information About the Identity Firewall, page 1](#)
- [Licensing for the Identity Firewall, page 8](#)
- [Guidelines and Limitations, page 8](#)
- [Prerequisites, page 9](#)
- [Configuring the Identity Firewall, page 10](#)
- [Monitoring the Identity Firewall, page 25](#)
- [Feature History for the Identity Firewall, page 28](#)

## Information About the Identity Firewall

This section includes the following topics:

- [Overview of the Identity Firewall, page 1](#)
- [Architecture for Identity Firewall Deployments, page 2](#)
- [Features of the Identity Firewall, page 3](#)
- [Deployment Scenarios, page 4](#)
- [Cut-through Proxy and VPN Authentication, page 7](#)

## Overview of the Identity Firewall

In an enterprise, users often need access to one or more server resources. Typically, a firewall is not aware of the users' identities and, therefore, cannot apply security policies based on identity. To configure per-user access policies, you must configure a user authentication proxy, which requires user interaction (a user name/password query).

The Identity Firewall in the ASA provides more granular access control based on users' identities. You can configure access rules and security policies based on user names and user groups name rather than through source IP addresses. The ASA applies the security policies based on an association of IP addresses to Windows Active Directory login information and reports events based on the mapped user names instead of network IP addresses.

The Identity Firewall integrates with Microsoft Active Directory in conjunction with an external Active Directory (AD) Agent that provides the actual identity mapping. The ASA uses Windows Active Directory as the source to retrieve the current user identity information for specific IP addresses and allows transparent authentication for Active Directory users.

Identity-based firewall services enhance the existing access control and security policy mechanisms by allowing users or groups to be specified in place of source IP addresses. Identity-based security policies can be interleaved without restriction between traditional IP address based rules.

The key benefits of the Identity Firewall include:

- Decoupling network topology from security policies
- Simplifying the creation of security policies
- Providing the ability to easily identify user activities on network resources
- Simplify user activity monitoring

## Architecture for Identity Firewall Deployments

The Identity Firewall integrates with Window Active Directory in conjunction with an external Active Directory (AD) Agent that provides the actual identity mapping.

The identity firewall consists of three components:

- **ASA**
- **Microsoft Active Directory**

Though Active Directory is part of the Identity Firewall on the ASA, they are managed by Active Directory administrators. The reliability and accuracy of the data depends on data in Active Directory.

Supported versions include Windows Server 2003, Windows Server 2008, and Windows Server 2008 R2 servers.

- **Active Directory (AD) Agent**

The AD Agent runs on a Windows server. Supported Windows servers include Windows 2003, Windows 2008, and Windows 2008 R2.

**Note**

---

Windows 2003 R2 is not supported for the AD Agent server.

---

**Figure 36-1 Identity Firewall Components**

|   |                                                                                                                                                                                                                                                                                                              |   |                                                                                                                                                                                                                                                                                                                                       |
|---|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | <b>On the ASA:</b> Configure local user groups and Identity Firewall policies.                                                                                                                                                                                                                               | 4 | <b>Client &lt;-&gt; ASA:</b> The client logs onto the network through Microsoft Active Directory. The AD Server authenticates users and generates user logon security logs.<br><br>Alternatively, the client can log onto the network through a cut-through proxy or by using VPN.                                                    |
| 2 | <b>ASA &lt;-&gt; AD Server:</b> The ASA sends an LDAP query for the Active Directory groups configured on the AD Server.<br><br>The ASA consolidates local and Active Directory groups and applies access rules and MPF security policies based on user identity.                                            | 5 | <b>ASA &lt;-&gt; Client:</b> Based on the policies configured on the ASA, it grants or denies access to the client.<br><br>If configured, the ASA probes the NetBIOS of the client to pass inactive and no-response users.                                                                                                            |
| 3 | <b>ASA &lt;-&gt; AD Agent:</b> Depending on the Identity Firewall configuration, the ASA downloads the IP-user database or sends a RADIUS request to the AD Agent querying the user's IP address.<br><br>The ASA forwards the new mappings learned from web authentication and VPN sessions to the AD Agent. | 6 | <b>AD Agent &lt;-&gt; AD Server:</b> Periodically or on-demand, the AD Agent monitors the AD Server security event log file via WMI for client login and logoff events.<br><br>The AD Agent maintains a cache of user ID and IP address mappings, and notifies the ASA of changes.<br><br>The AD Agent sends logs to a syslog server. |

## Features of the Identity Firewall

The Identity Firewall has the following key features.

### Flexibility

- The ASA can retrieve user identity and IP address mappings from the AD Agent by querying the AD Agent for each new IP address or by maintaining a local copy of the entire user identity and IP address database.
- Supports host group, subnet, or IP address for the destination of a user identity policy.
- Supports a fully qualified domain name (FQDN) for the source and destination of a user identity policy.

- Supports the combination of 5-tuple policies with ID-based policies. The identity-based feature works in tandem with existing 5-tuple solution.
- Supports usage with IPS and Application Inspection policies.
- Retrieves user identity information from remote access VPN, AnyConnect VPN, L2TP VPN and cut-through proxy. All retrieved users are populated to all ASA devices connected to the AD Agent.

#### Scalability

- Each AD Agent supports 100 ASA devices. Multiple ASA devices are able to communicate with a single AD Agent to provide scalability in larger network deployments.
- Supports 30 Active Directory servers provided the IP address is unique among all domains.
- Each user identity in a domain can have up to 8 IP addresses.
- Supports up to 64,000 user identity-IP address mappings in active ASA policies for ASA 5500 Series models. This limit controls the maximum users who have policies applied. The total users are the aggregated users configured on all different contexts.
- Supports up to 1024 user identity-IP address mappings in active ASA policies for the ASA 5505.
- Supports up to 256 user groups in active ASA policies.
- A single rule can contain one or more user groups or users.
- Supports multiple domains.

#### Availability

- The ASA retrieves group information from Active Directory and falls back to web authentication for IP addresses that the AD Agent cannot map a source IP address to a user identity.
- The AD Agent continues to function when any of the Active Directory servers or the ASA are not responding.
- Supports configuring a primary AD Agent and a secondary AD Agent on the ASA. If the primary AD Agent stops responding, the ASA can switch to the secondary AD Agent.
- If the AD Agent is unavailable, the ASA can fall back to existing identity sources such as cut through proxy and VPN authentication.
- The AD Agent runs a watchdog process that automatically restarts its services when they are down.
- Allows a distributed IP address/user mapping database among ASA devices.

## Deployment Scenarios

You can deploy the components of the Identity Firewall in the following ways depending on your environmental requirement.

As shown in [Figure 36-2](#), you can deploy the components of the Identity Firewall to allow for redundancy. Scenario 1 shows a simple installation without component redundancy.

Scenario 2 also shows a simple installation without redundancy. However, in that deployment scenario, the Active Directory server and AD Agent are co-located on one Windows server.

**Figure 36-2** *Deployment Scenario without Redundancy*  
No Redundancy

As shown in [Figure 36-3](#), you can deploy the Identity Firewall components to support redundancy. Scenario 1 shows a deployment with multiple Active Directory servers and a single AD Agent installed on a separate Windows server. Scenario 2 shows a deployment with multiple Active Directory servers and multiple AD Agents installed on separate Windows servers.

**Figure 36-3** *Deployment Scenario with Redundant Components*  
Redundant

As shown in [Figure 36-4](#), all Identity Firewall components—Active Directory server, the AD Agent, and the clients—are installed and communicate on the LAN.

**Figure 36-4** *LAN-based Deployment*

Figure 36-5 shows a WAN-based deployment to support a remote site. The Active Directory server and the AD Agent are installed on the main site LAN. The clients are located at a remote site and connect to the Identity Firewall components over a WAN.

Figure 36-6 also shows a WAN-based deployment to support a remote site. The Active Directory server is installed on the main site LAN. However, the AD Agent is installed and accessed by the clients at the remote site. The remote clients connect to the Active Directory servers at the main site over a WAN.

Figure 36-7 shows an expanded remote site installation. An AD Agent and Active Directory servers are installed at the remote site. The clients access these components locally when logging into network resources located at the main site. The remote Active Directory server must synchronize its data with the central Active Directory servers located at the main site.

## Cut-through Proxy and VPN Authentication

In an enterprise, some users log onto the network by using other authentication mechanisms, such as authenticating with a web portal (cut-through proxy) or by using a VPN. For example, users with a Macintosh and Linux client might log in a web portal (cut-through proxy) or by using a VPN. Therefore, you must configure the Identity Firewall to allow these types of authentication in connection with identity-based access policies.

Figure 36-8 shows a deployment to support a cut-through proxy authentication captive portal. Active Directory servers and the AD Agent are installed on the main site LAN. However, the Identity Firewall is configured to support authentication of clients that are not part of the Active Directory domain.

**Figure 36-8 Deployment Supporting Cut-through Proxy Authentication**

The ASA designates users logging in through a web portal (cut-through proxy) as belonging to the Active Directory domain with which they authenticated.

The ASA designates users logging in through a VPN as belonging to the LOCAL domain unless the VPN is authenticated by LDAP with Active Directory, then the Identity Firewall can associate the users with their Active Directory domain.

The ASA reports users logging in through VPN authentication or a web portal (cut-through proxy) to the AD Agent, which distributes the user information to all registered ASA devices. Specifically, the user identity-IP address mappings of authenticated users are forwarded to all ASA contexts that contain the input interface where packets are received and authenticated.

See [Configuring Cut-through Proxy Authentication, page 22](#).

# Licensing for the Identity Firewall

The following table shows the licensing requirements for this feature:

| Model      | License Requirement |
|------------|---------------------|
| All models | Base License.       |

## Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

### Context Mode Guidelines

Supported in single and multiple context mode.

### Firewall Mode Guidelines

Supported in routed and transparent firewall modes.

### Failover Guidelines

The Identity Firewall supports user identity-IP address mappings and AD Agent status replication from active to standby when stateful failover is enabled. However, only user identity-IP address mappings, AD Agent status, and domain status are replicated. User and user group records are not replicated to the standby ASA.

When failover is configured, the standby ASA must also be configured to connect to the AD Agent directly to retrieve user groups. The standby ASA does not send NetBIOS packets to clients even when the NetBIOS probing options are configured for the Identity Firewall.

When a client is determined as inactive by the active ASA, the information is propagated to the standby ASA. User statistics are not propagated to the standby ASA.

When you have failover configured, you must configure the AD Agent to communicate with both the active and standby ASA devices. See the *Installation and Setup Guide for the Active Directory Agent* for the steps to configure the ASA on the AD Agent server.

### IPv6 Guidelines

- Supports IPv6.

The AD Agent supports endpoints with IPv6 addresses. It can receive IPv6 addresses in log events, maintain them in its cache, and send them through RADIUS messages.

- NetBIOS over IPv6 is not supported
- Cut through proxy over IPv6 is not supported.

### Additional Guidelines and Limitations

- A full URL as a destination address is not supported.
- For NetBIOS probing to function, the network between the ASA, AD Agent, and clients must support UDP-encapsulated NetBIOS traffic.

- MAC address checking by the Identity Firewall does not work when intervening routers are present. Users logged onto clients that are behind the same router have the same MAC addresses. With this implementation, all the packets from the same router are able to pass the check, because the ASA is unable to ascertain the actual MAC addresses behind the router.
- The following ASA features do not support using the identity-based object and FQDN:
  - route-map
  - Crypto map
  - WCCP
  - NAT
  - group-policy (except VPN filter)
  - DAP

See [Configuring Identity-based Access Rules, page 20](#).

## Prerequisites

Before configuring the Identity Firewall in the ASA, you must meet the prerequisites for the AD Agent and Microsoft Active Directory.

### AD Agent

The AD Agent must be installed on a Windows server that is accessible to the ASA. Additionally, you must configure the AD Agent to obtain information from the Active Directory servers. Configure the AD Agent to communicate with the ASA.

Supported Windows servers include Windows 2003, Windows 2008, and Windows 2008 R2.

---

**Note** Windows 2003 R2 is not supported for the AD Agent server.

---

For the steps to install and configure the AD Agent, see the *Installation and Setup Guide for the Active Directory Agent*.

Before configuring the AD Agent in the ASA, obtain the secret key value that the AD Agent and the ASA use to communicate. This value must match on both the AD Agent and the ASA.

### Microsoft Active Directory

Microsoft Active Directory must be installed on a Windows server and accessible by the ASA. Supported versions include Windows 2003, 2008, and 2008 R2 servers.

Before configuring the Active Directory server on the ASA, create a user account in Active Directory for the ASA.

Additionally, the ASA sends encrypted log in information to the Active Directory server by using SSL enabled over LDAP. SSL must be enabled on the Active Directory server. See the documentation for Microsoft Active Directory for the steps to enable SSL for Active Directory.

**Note**

Before running the AD Agent Installer, you must install the following patches on every Microsoft Active Directory server that the AD Agent monitors. These patches are required even when the AD Agent is installed directly on the domain controller server. See the *README First for the Cisco Active Directory Agent*.

## Configuring the Identity Firewall

This section contains the following topics:

- [Task Flow for Configuring the Identity Firewall, page 10](#)
- [Configuring the Active Directory Domain, page 11](#)
- [Configuring Active Directory Agents, page 13](#)
- [Configuring Identity Options, page 14](#)
- [Configuring Identity-based Access Rules, page 20](#)
- [Configuring Cut-through Proxy Authentication, page 22](#)
- [Configuring VPN Authentication, page 24](#)

## Task Flow for Configuring the Identity Firewall

### Prerequisite

Before configuring the Identity Firewall in the ASA, you must meet the prerequisites for the AD Agent and Microsoft Active Directory. See [Prerequisites, page 9](#) for information.

### Task Flow in the ASA

To configure the Identity Firewall, perform the following tasks:

- 
- Step 1** Configure the Active Directory domain in the ASA.  
See [Configuring the Active Directory Domain, page 11](#).  
See also [Deployment Scenarios, page 4](#) for the ways in which you can deploy the Active Directory servers to meet your environment requirements.
- Step 2** Configure the AD Agent in ASA.  
See [Configuring Active Directory Agents, page 13](#).  
See also [Deployment Scenarios, page 4](#) for the ways in which you can deploy the AD Agents to meet your environment requirements.
- Step 3** Configure Identity Options.  
See [Configuring Identity Options, page 14](#).
- Step 4** Configure Identity-based Access Rules in the ASA.  
After AD domain and AD-Agent are configured, identity-based rules can be specified to enforce identity-based rules. See [Configuring Identity-based Access Rules, page 20](#).
- Step 5** Configure the cut-through proxy.

See [Configuring Cut-through Proxy Authentication, page 22](#).

**Step 6** Configure VPN authentication.

See [Configuring VPN Authentication, page 24](#).

## Configuring the Active Directory Domain

Active Directory domain configuration on the ASA is required for the ASA to download Active Directory groups and accept user identities from specific domains when receiving IP-user mapping from the AD Agent.

### Prerequisites

- Active Directory server IP address
- Distinguished Name for LDAP base dn
- Distinguished Name and password for the Active Directory user that the Identity Firewall uses to connect to the Active Directory domain controller

To configure the Active Directory domain, perform the following steps:

|               | Command                                                                                                                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                         |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | hostname(config)# <b>aaa-server</b> <i>server-tag</i> <b>protocol</b> <b>ldap</b><br><b>Example:</b><br>hostname(config)# aaa-server adserver protocol ldap                                                                                                                                               | Creates the AAA server group and configures AAA server parameters for the Active Directory server.                                                                                                                                                                                                                              |
| <b>Step 2</b> | hostname(config-aaa-server-group)# <b>aaa-server</b> <i>server-tag</i> [( <i>interface-name</i> )] <b>host</b> { <i>server-ip</i>   <i>name</i> } [ <i>key</i> ] [ <b>timeout</b> <i>seconds</i> ]<br><b>Example:</b><br>hostname(config-aaa-server-group)# aaa-server adserver (mgmt) host 172.168.224.6 | For the Active Directory server, configures the AAA server as part of a AAA server group and the AAA server parameters that are host-specific.                                                                                                                                                                                  |
| <b>Step 3</b> | hostname( <b>config-aaa-server-host</b> )# <b>ldap-base-dn</b> <i>string</i><br><b>Example:</b><br>hostname(config-aaa-server-host)# ldap-base-dn DC=SAMPLE,DC=com                                                                                                                                        | Specifies the location in the LDAP hierarchy where the server should begin searching when it receives an authorization request.<br><br>Specifying the <b>ldap-base-dn</b> command is optional. If you do not specify this command, the ASA retrieves the defaultNamingContext from Active Directory and uses it as the base DN. |
| <b>Step 4</b> | hostname(config-aaa-server-host)# <b>ldap-scope</b> <b>subtree</b>                                                                                                                                                                                                                                        | Specifies the extent of the search in the LDAP hierarchy that the server should make when it receives an authorization request.                                                                                                                                                                                                 |
| <b>Step 5</b> | hostname(config-aaa-server-host)# <b>ldap-login-password</b> <i>string</i><br><b>Example:</b><br>hostname(config-aaa-server-host)# ldap-login-password obscurepassword                                                                                                                                    | Specifies the login password for the LDAP server.                                                                                                                                                                                                                                                                               |

|                | Command                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 6</b>  | <pre>hostname(config-aaa-server-host)# ldap-login-dn string <b>Example:</b> hostname(config-aaa-server-host)# ldap-login-dn SAMPLE\user1</pre>                                            | <p>Specifies the name of the directory object that the system should bind this as. The ASA identifies itself for authenticated binding by attaching a Login DN field to the user authentication request. The Login DN field describes the authentication characteristics of the ASA.</p> <p>Where <i>string</i> is a case-sensitive string of up to 128 characters that specifies the name of the directory object in the LDAP hierarchy. Spaces are not permitted in the string, but other special characters are allowed.</p> <p>You can specify the traditional or simplified format. The traditional ldap-login-dn in format includes: CN=username,OU=Employees,OU=Sample Users,DC=sample,DC=com is accepted also.</p> |
| <b>Step 7</b>  | <pre>hostname(config-aaa-server-host)# server-type microsoft</pre>                                                                                                                        | Configures the LDAP server model for the Microsoft Active Directory server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 8</b>  | <pre>hostname(config-aaa-server-host)# ldap-group-base-dn string <b>Example:</b> hostname(config-aaa-server-host)# ldap-group-base-dn OU=Sample Groups,DC=SAMPLE,DC=com</pre>             | <p>Specifies location of the Active Directory groups configuration in the Active Directory domain controller. If not specified, the value in ldap-base-dn is used.</p> <p>Specifying the <b>ldap-group-base-dn</b> command is optional.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 9</b>  | <pre>hostname(config-aaa-server-host)# ldap-over-ssl enable</pre>                                                                                                                         | <p>Allows the ASA to access the Active Directory domain controller over SSL. To support LDAP over SSL, Active Directory server needs to be configured to have this support.</p> <p>By default, Active Directory does not have SSL configured. If SSL is not configured on on Active Directory, you do not need to configure it on the ASA for the Identity Firewall.</p>                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 10</b> | <pre>hostname(config-aaa-server-host)# server-port port-number <b>Examples:</b> hostname(config-aaa-server-host)# server-port 389 hostname(config-aaa-server-host)# server-port 636</pre> | By default, if ldap-over-ssl is not enabled, the default server-port is 389; if ldap-over-ssl is enabled, the default server-port is 636.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 11</b> | <pre>hostname(config-aaa-server-host)# group-search-timeout seconds <b>Examples:</b> hostname(config-aaa-server-host)# group-search-timeout 300</pre>                                     | Sets the amount of time before LDAP queries time out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## What to Do Next

Configure AD Agents. See [Configuring Active Directory Agents, page 13](#).

## Configuring Active Directory Agents

Periodically or on-demand, the AD Agent monitors the Active Directory server security event log file via WMI for user login and logoff events. The AD Agent maintains a cache of user ID and IP address mappings, and notifies the ASA of changes.

Configure the primary and secondary AD Agents for the AD Agent Server Group. When the ASA detects that the primary AD Agent is not responding and a secondary agent is specified, the ASA switches to secondary AD Agent. The Active Directory server for the AD agent uses RADIUS as the communication protocol; therefore, you should specify a key attribute for the shared secret between ASA and AD Agent.

### Requirement

- AD agent IP address
- Shared secret between ASA and AD agent

To configure the AD Agents, perform the following steps:

|               | Command                                                                                                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | hostname(config)# <b>aaa-server</b> <i>server-tag</i> <b>protocol</b> <b>radius</b><br><b>Example:</b><br>hostname(config)# aaa-server adagent protocol radius                                                                                                                                      | Creates the AAA server group and configures AAA server parameters for the AD Agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 1</b> | hostname(config)# <b>ad-agent-mode</b>                                                                                                                                                                                                                                                              | Enables the AD Agent mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 2</b> | hostname(config-aaa-server-group)# <b>aaa-server</b> <i>server-tag</i> [( <i>interface-name</i> )] <b>host</b> { <i>server-ip</i>   <i>name</i> } [ <i>key</i> ] [ <i>timeout seconds</i> ]<br><b>Example:</b><br>hostname(config-aaa-server-group)# aaa-server adagent (inside) host 192.168.1.101 | For the AD Agent, configures the AAA server as part of a AAA server group and the AAA server parameters that are host-specific.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 3</b> | hostname(config-aaa-server-host)# <b>key</b> <i>key</i><br><b>Example:</b><br>hostname(config-aaa-server-host)# key mysecret                                                                                                                                                                        | Specifies the server secret value used to authenticate the ASA to the AD Agent server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 4</b> | hostname(config-aaa-server-host)# <b>user-identity</b> <b>ad-agent</b> <b>aaa-server</b> <i>aaa_server_group_tag</i><br><b>Examples:</b><br>hostname(config-aaa-server-hostkey )# user-identity ad-agent aaa-server adagent                                                                         | Defines the server group of the AD Agent.<br><br>The first server defined in <i>aaa_server_group_tag</i> variable is the primary AD Agent and the second server defined is the secondary AD Agent.<br><br>The Identity Firewall supports defining only two AD-Agent hosts.<br><br>When ASA detects the primary AD Agent is down and a secondary agent is specified, it switches to secondary AD Agent. The aaa-server for the AD agent uses RADIUS as the communication protocol, and should specify key attribute for the shared secret between ASA and AD Agent. |
| <b>Step 5</b> | hostname(config-aaa-server-host)# <b>test</b> <b>aaa-server</b> <b>ad-agent</b>                                                                                                                                                                                                                     | Tests the communication between the ASA and the AD Agent server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### What to Do Next

Configure access rules for the Identity Firewall. See [Configuring Identity-based Access Rules](#), page 20.

## Configuring Identity Options

Perform this procedure to add or edit the Identity Firewall feature; select the Enable check box to enable the feature. By default, the Identity Firewall feature is disabled.

### Prerequisites

Before configuring the identify options for the Identity Firewall, you must you must meet the prerequisites for the AD Agent and Microsoft Active Directory. See [Prerequisites, page 9](#) the requirements for the AD Agent and Microsoft Active Directory installation.

To configure the Identity Options for the Identity Firewall, perform the following steps:

|               | Command                                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <code>hostname(config)# user-identity enable</code>                                                                                                                                                | Enables the Identity Firewall feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 2</b> | <code>hostname(config)# user-identity default-domain domain_NetBIOS_name</code><br><b>Example:</b><br><code>hostname(config)# user-identity default-domain SAMPLE</code>                           | <p>Specifies the default domain for the Identity Firewall.</p> <p>For <i>domain_NetBIOS_name</i>, enter a name up to 32 characters consisting of [a-z], [A-Z], [0-9], [!@#%\$%^&amp;()-_+=[]{};,.] except '.' and '' at the first character. If the domain name contains a space, enclose the entire name in quotation marks. The domain name is not case sensitive.</p> <p>The default domain is used for all users and user groups when a domain has not been explicitly configured for those users or groups. When a default domain is not specified, the default domain for users and groups is LOCAL. For multiple context modes, you can set a default domain name for each context, as well as within the system execution space.</p> <p><b>Note</b> The default domain name you specify must match the NetBIOS domain name configured on the Active Directory domain controller. If the domain name does not match, the AD Agent will incorrectly associate the user identity-IP address mappings with the domain name you enter when configuring the ASA. To view the NetBIOS domain name, open the Active Directory user event security log in any text editor.</p> <p>The Identity Firewall uses the LOCAL domain for all locally defined user groups or locally defined users. Users logging in through a web portal (cut-through proxy) are designated as belonging to the Active Directory domain with which they authenticated. Users logging in through a VPN are designated as belonging to the LOCAL domain unless the VPN is authenticated by LDAP with Active Directory, then the Identity Firewall can associate the users with their Active Directory domain.</p> |
| <b>Step 3</b> | <code>hostname(config)# user-identity domain domain_nickname aaa-server aaa_server_group_tag</code><br><b>Example:</b><br><code>hostname(config)# user-identity domain SAMPLE aaa-server ds</code> | <p>Associates the LDAP parameters defined for the AAA server for importing user group queries with the domain name.</p> <p>For <i>domain_nickname</i>, enter a name up to 32 characters consisting of [a-z], [A-Z], [0-9], [!@#%\$%^&amp;()-_+=[]{};,.] except '.' and '' at the first character. If the domain name contains a space, you must enclose that space character in quotation marks. The domain name is not case sensitive.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|        | Command                                                                                                                                                                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <pre>hostname(config)# user-identity logout-probe netbios local-system probe-time minutes minutes retry-interval seconds seconds retry-count times [user-not-needed match-any exact-match] Example: hostname(config)# user-identity logout-probe netbios local-system probe-time minutes 10 retry-interval seconds 10 retry-count 2 user-not-needed</pre> | <p>Enables NetBIOS probing. Enabling this option configures how often the ASA probes the user client IP address to determine whether the client is still active. By default, NetBIOS probing is disabled.</p> <p>To minimize the NetBIOS packets, the ASA only sends a NetBIOS probe to a client when the user has been idle for more than the specified number of minutes.</p> <p>Set the NetBIOS probe timer from 1 to 65535 minutes and the retry interval from 1 to 256 retries. Specify the number of times to retry the probe:</p> <ul style="list-style-type: none"> <li>• <b>match-any</b>—As long as the NetBIOS response from the client contains the user name of the user assigned to the IP address, the user identity is be considered valid. Specifying this option requires that the client enabled the Messenger service and configured a WINS server.</li> <li>• <b>exact-match</b>—The user name of the user assigned to the IP address must be the only one in the NetBIOS response. Otherwise, the user identity of that IP address is considered invalid. Specifying this option requires that the client enabled the Messenger service and configured a WINS server.</li> <li>• <b>user-not-needed</b>—As long as the ASA received a NetBIOS response from the client the user identity is considered valid.</li> </ul> <p>The Identity Firewall only performs NetBIOS probing for those users identities that are in the active state and exist in at least one security policy. The ASA does not perform NetBIOS probing for clients where the users logged in through cut-through proxy or by using VPN.</p> |

|               | Command                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b> | <pre>hostname(config)# user-identity inactive-user-timer minutes minutes</pre> <p><b>Example:</b></p> <pre>hostname(config)# user-identity inactive-user-timer minutes 120</pre>           | <p>Specifies the amount of time before a user is considered idle, meaning the ASA has not received traffic from the user's IP address for specified amount of time.</p> <p>When the timer expires, the user's IP address is marked as inactive and removed from the local cached user identity-IP address mappings database and the ASA no longer notifies the AD Agent about that IP address removal. Existing traffic is still allowed to pass. When this command is specified, the ASA runs an inactive timer even when the NetBIOS Logout Probe is configured.</p> <p>By default, the idle timeout is set to 60 minutes.</p> <p><b>Note</b> The Idle Timeout option does not apply to VPN or cut through proxy users.</p> |
| <b>Step 6</b> | <pre>hostname(config)# user-identity poll-import-user-group-timer hours hours</pre> <p><b>Example:</b></p> <pre>hostname(config)# user-identity poll-import-user-group-timer hours 1</pre> | <p>Specifies the amount of time before the ASA queries the Active Directory server for user group information.</p> <p>If a user is added to or deleted from to an Active Directory group, the ASA received the updated user group after import group timer runs.</p> <p>By default, the <b>poll-import-user-group-timer</b> is 8 hours.</p> <p>To immediately update user group information, enter the following command:</p> <p><b>user-identity update import-user</b></p> <p>See the <i>Cisco ASA 5500 Series Configuration Guide using the CLI</i></p>                                                                                                                                                                    |
| <b>Step 7</b> | <pre>hostname(config)# user-identity action netbios-response-fail remove-user-ip</pre>                                                                                                     | <p>Specifies the action when a client does not respond to a NetBIOS probe. For example, the network connection might be blocked to that client or the client is not active.</p> <p>When the <b>user-identity action remove-user-ip</b> is configured, the ASA removed the user identity-IP address mapping for that client.</p> <p>By default, this command is disabled.</p>                                                                                                                                                                                                                                                                                                                                                  |

|                | Command                                                                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 8</b>  | <pre>hostname(config)# user-identity action domain-controller-down domain_nickname disable-user-identity-rule Example: hostname(config)# user-identity action domain-controller-down SAMPLE disable-user-identity-rule</pre> | <p>Specifies the action when the domain is down because Active Directory domain controller is not responding.</p> <p>When the domain is down and the <b>disable-user-identity-rule</b> keyword is configured, the ASA disables the user identity-IP address mappings for that domain. Additionally, the status of all user IP addresses in that domain are marked as disabled in the output displayed by the <b>show user-identity user</b> command.</p> <p>By default, this command is disabled.</p> |
| <b>Step 9</b>  | <pre>hostname(config)# user-identity user-not-found enable</pre>                                                                                                                                                             | <p>Enables user-not-found tracking. Only the last 1024 IP addresses tracked.</p> <p>By default, this command is disabled.</p>                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 10</b> | <pre>hostname(config)# user-identity action ad-agent-down disable-user-identity-rule</pre>                                                                                                                                   | <p>Specifies the action when the AD Agent is not responding.</p> <p>When the AD Agent is down and the <b>user-identity action ad-agent-down</b> is configured, the ASA disables the user identity rules associated with the users in that domain. Additionally, the status of all user IP addresses in that domain are marked as disabled in the output displayed by the <b>show user-identity user</b> command.</p> <p>By default, this command is disabled.</p>                                     |
| <b>Step 11</b> | <pre>hostname(config)# user-identity action mac-address-mismatch remove-user-ip</pre>                                                                                                                                        | <p>Specifies the action when a user's MAC address is found to be inconsistent with the ASA device IP address currently mapped to that MAC address.</p> <p>When the <b>user-identity action mac-address-mismatch</b> command is configured, the ASA removes the user identity-IP address mapping for that client.</p> <p>By default, the ASA uses the <b>remove-user-ip</b> keyword when this command is specified.</p>                                                                                |

|                | Command                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 12</b> | <pre>hostname(config)# user-identity ad-agent active-user-database {on-demand full-download} <b>Example:</b> hostname(config)# user-identity ad-agent active-user-database full-download</pre>   | <p>Defines how the ASA retrieves the user identity-IP address mapping information from the AD Agent:</p> <ul style="list-style-type: none"> <li>• <b>full-download</b>—Specifies that the ASA send a request to the AD Agent to download the entire IP-user mapping table when the ASA starts and then to receive incremental IP-user mapping when users log in and log out.</li> <li>• <b>on-demand</b>—Specifies that the ASA retrieve the user mapping information of an IP address from the AD Agent when the ASA receives a packet that requires a new connection and the user of its source IP address is not in the user-identity database.</li> </ul> <p>By default, the ASA 5505, uses the on-demand option. The other ASA platforms use the full-download option.</p> <p>Full downloads are event driven, meaning that subsequent requests to download the database, send just the updates to the user identity-IP address mapping database.</p> <p>When the ASA registers a change request with the AD Agent, the AD Agent sends a new event to the ASA.</p> |
| <b>Step 13</b> | <pre>hostname(config)# user-identity ad-agent hello-timer seconds seconds retry-times number <b>Example:</b> hostname(config)# user-identity ad-agent hello-timer seconds 20 retry-times 3</pre> | <p>Defines the hello timer between the ASA and the AD Agent.</p> <p>The hello timer between the ASA and the AD Agent defines how frequently the ASA exchanges hello packets. The ASA uses the hello packet to obtain ASA replication status (in-sync or out-of-sync) and domain status (up or down). If the ASA does not receive a response from the AD Agent, it resends a hello packet after the specified interval.</p> <p>By default, the hello timer is set to 30 seconds and 5 retries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 14</b> | <pre>hostname(config)# user-identity ad-agent aaa-server aaa_server_group_tag <b>Example:</b> hostname(config)# user-identity ad-agent aaa-server adagent</pre>                                  | <p>Defines the server group of the AD Agent.</p> <p>For <i>aaa_server_group_tag</i>, enter the value defined by the <b>aaa-server</b> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## What to Do Next

Configure the Active Directory domain and server groups. See [Configuring the Active Directory Domain, page 11](#).

Configure AD Agents. See [Configuring Active Directory Agents, page 13](#).

## Configuring Identity-based Access Rules

An access rule permits or denies traffic based on the protocol, a source and destination IP address or network, and the source and destination ports. For information about access rules, see in [Chapter 34, “Configuring Access Rules.”](#)

The Identity Firewall feature adds the ability to permit or deny traffic based on a users’ identities or based on a user group. You configure access rules and security policies based on user names and user groups name in addition to source IP addresses. The ASA applies the security policies based on an association of IP addresses to Windows Active Directory login information and reports events based on the mapped user names instead of network IP addresses.

Users can be local, remote (via VPN), wired or wireless. Server resources can include server IP address, server DNS name, or domain.

Identity-based access rules follow the same general format that standard IP-address-based rules follow: action, protocol, source, destination, and optional source service when the protocol for the rule is TCP or UDP. In addition, they include specifying user and user group objects before traditional IP-address-based objects—any, network object/network group, interface, host, IP address, and network mask.

You can create access rules that solely contain identity-based objects (users and user groups) or combine identity-based objects with traditional IP-address-based objects. You can create an access rule that includes a source user or source user group from a qualifying IP-address-based source. For example, you could create an access rule for `sample_user1 11.0.0.0 255.0.0.0`, meaning the user could have any IP address on subnet 11.0.0.0/8.

You can create an access rule with FQDN in the source and the destination.

The destination portion of an identity-based access rule follows the same format and guidelines as traditional IP-address-based access rules.

### Guidelines and Limitations

- Supports up to 64,000 user identity-IP address mappings in active ASA policies for ASA 5500 Series models.  
This limit controls the maximum users who have policies applied. The total users are the aggregated users configured on all different contexts.
- Supports up to 1024 user identity-IP address mappings in active ASA policies for the ASA 5505.  
This limit controls the maximum users who have policies applied. The total users are the aggregated users configured on all different contexts.
- Supports up to 256 user groups in active ASA security policies.
- A single rule can contain one or more user groups or users.

### Prerequisites

After AD domain and AD-Agent are configured, Identity-based rules can be specified to enforce identity-based rules.

To configure identity-based access rules, perform the following steps:

|               | Command                                                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <pre>hostname(config)# object-group user user_group_name</pre> <p><b>Examples:</b></p> <pre>hostname(config)# object-group user users1</pre>                                                           | Defines object groups that you can use to control access with the Identity Firewall. You can use the object group as part of an access group or service policy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 2</b> | <pre>hostname(config-user-object-group)# user domain_NetBIOS_name\user_name</pre> <p><b>Examples:</b></p> <pre>hostname(config-user-object-group)# user SAMPLE\users1</pre>                            | <p>Specifies the user to add to the access rule.</p> <p>The <i>user_name</i> can contain any character including [a-z], [A-Z], [0-9], [!@#%&amp;()-_{ } .]. If <i>domain_NetBIOS_name\user_name</i> contains a space, you must enclose the domain name and user name in quotation marks.</p> <p>The <i>user_name</i> can be part of the LOCAL domain or a user imported by the ASA from Active Directory domain.</p> <p>If the <i>domain_NetBIOS_name</i> is associated with a AAA server, the <i>user_name</i> must be the Active Directory sAMAccountName, which is unique, instead of the common name (cn), which might not be unique.</p> <p>The <i>domain_NetBIOS_name</i> can be LOCAL or the actual domain name as specified in <b>user-identity domain domain_NetBIOS_name aaa-server aaa_server_group_tag</b> command.</p> |
| <b>Step 3</b> | <pre>hostname(config-user-object-group)# user-group domain_NetBIOS_name\user_group_name</pre> <p><b>Examples:</b></p> <pre>hostname(config-user-object-group)# user-group SAMPLE\group.marketing</pre> | <p>Specifies a user group to add to the access rule.</p> <p>The <i>group_name</i> can contain any character including [a-z], [A-Z], [0-9], [!@#%&amp;()-_{ } .]. If <i>domain_NetBIOS_name\group_name</i> contains a space, you must enclose the domain name and user name in quotation marks.</p> <p>Specifying the <i>domain_NetBIOS_name</i> for <b>user-group</b> has the same requirements as specifying it for <b>user</b>.</p> <p>The ASA imports the nested user groups from in Active Directory when the access rule is used in an access group or service policy.</p>                                                                                                                                                                                                                                                     |
| <b>Step 4</b> | <pre>hostname(config-user-object-group)# exit</pre>                                                                                                                                                    | Exit from the configure user object group mode to the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|               | Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Configuring Cut-through Proxy Authentication

In an enterprise, some users log onto the network by using other authentication mechanisms, such as authenticating with a web portal (cut-through proxy) or by using a VPN. For example, users with a Macintosh and Linux client might log in a web portal (cut-through proxy) or by using a VPN. Therefore, you must configure the Identity Firewall to allow these types of authentication in connection with identity-based access policies.

The ASA designates users logging in through a web portal (cut-through proxy) as belonging to the Active Directory domain with which they authenticated. The ASA designates users logging in through a VPN as belonging to the LOCAL domain unless the VPN is authenticated by LDAP with Active Directory, then the Identity Firewall can associate the users with their Active Directory domain. The ASA reports users logging in through VPN authentication or a web portal (cut-through proxy) to the AD Agent, which distributes the user information to all registered ASA devices.

Users can log in by using HTTP/HTTPS, FTP, Telnet, or SSH. When users log in with these authentication methods, the following guidelines apply:

- For HTTP/HTTPS traffic, an authentication window appears for unauthenticated users.
- For Telnet and FTP traffic, users must log in through the cut-through proxy and again to Telnet and FTP server.
- A user can specify an Active Directory domain while providing login credentials (in the format domain\username). The ASA automatically selects the associated AAA server group for the specified domain.
- If a user specifies an Active Directory domain while providing login credentials (in the format domain\username), the ASA parses the domain and uses it to select an authentication server from the AAA servers configured for the Identity Firewall. Only the username is passed to the AAA server.

- If the backslash (\) delimiter is not found in the log in credentials, the ASA does not parse a domain and authentication is conducted with the AAA server that corresponds to default domain configured for the Identity Firewall.
- If a default domain or a server group is not configured for that default domain, the ASA rejects the authentication.
- If the domain is not specified, the ASA selects the AAA server group for the default domain that is configured for the Identity Firewall.

## Detailed Steps

To configure the cut-through proxy for the Identity Firewall, perform the following steps:

|               | Command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Step 4</b> | <pre>hostname(config)# <b>aaa authenticate match</b> <i>access_list_name</i> <b>inside user-identity</b> <b>Examples:</b> <b>aaa authenticate match</b> listenerAuth <b>inside</b> <b>user-identity</b></pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Enables authentication for connections through the ASA and matches it to the Identity Firewall feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Examples

### Example 1

This example shows a typical cut-through proxy configuration to allow a user to log in through the ASA. In this example, the following conditions apply:

- The ASA IP address is 172.1.1.118.
- The Active Directory domain controller has the IP address 71.1.2.93.
- The end user client has the IP address 172.1.1.118 and uses HTTPS to log in through a web portal.
- The user is authenticated by the Active Directory domain controller via LDAP.
- The ASA uses the inside interface to connect to the Active Directory domain controller on the corporate network.

```
hostname(config)# access-list AUTH extended permit tcp any 172.1.1.118 255.255.255.255 eq http
hostname(config)# access-list AUTH extended permit tcp any 172.1.1.118 255.255.255.255 eq https
hostname(config)# aaa-server LDAP protocol ldap
hostname(config-aaa-server-group)# aaa-server LDAP (inside) host 171.1.2.93
hostname(config-aaa-server-host)# ldap-base-dn DC=cisco,DC=com
hostname(config-aaa-server-host)# ldap-group-base-dn DC=cisco,DC=com
hostname(config-aaa-server-host)# ldap-scope subtree
hostname(config-aaa-server-host)# ldap-login-dn cn=kao,OU=Employees,OU=Cisco Users,DC=cisco,DC=com
hostname(config-aaa-server-host)# ldap-login-password *****
hostname(config-aaa-server-host)# ldap-over-ssl enable
hostname(config-aaa-server-host)# server-type microsoft
hostname(config-aaa-server-host)# aaa authentication match AUTH inside LDAP
hostname(config)#
hostname(config)# http server enable
hostname(config)# http 0.0.0.0 0.0.0.0 inside
hostname(config)#
hostname(config)# auth-prompt prompt Enter Your Authentication
hostname(config)# auth-prompt accept You are Good
hostname(config)# auth-prompt reject Goodbye
```

### Example 2

```
hostname(config)# access-list listenerAuth extended permit tcp any any
hostname(config)# aaa authentication match listenerAuth inside ldap
hostname(config)# aaa authentication listener http inside port 8888
hostname(config)# access-list 100 ex permit ip user SAMPLE\user1 any any
hostname(config)# access-list 100 ex deny ip user SAMPLE\user2 any any
hostname(config)# access-list 100 ex permit ip user NONE any any
hostname(config)# access-list 100 ex deny any any
hostname(config)# access-group 100 in interface inside
hostname(config)# aaa authenticate match 200 inside user-identity
```

In this example, the following guidelines apply:

- In **access-list** commands, “permit user NONE” rules should be written before the “access-list 100 ex deny any any” to allow unauthenticated incoming users trigger AAA Cut-Through Proxy.
- In **auth access-list** command, “permit user NONE” rules guarantee only unauthenticated trigger Cut-Through Proxy. Ideally they should be the last lines.

## Configuring VPN Authentication

In an enterprise, some traffic might need to bypass the Identity Firewall.

The ASA reports users logging in through VPN authentication or a web portal (cut-through proxy) to the AD Agent, which distributes the user information to all registered ASA devices. Specifically, the IP-user mapping of authenticated users is forwarded to all ASA contexts that contain the input interface where HTTP/HTTPS packets are received and authenticated. The ASA designates users logging in through a VPN as belonging the LOCAL domain.

There are two different ways to apply IDFW rules on VPN users.

- Apply VPN-Filter with bypassing access-list check disabled
- Apply VPN-Filter with bypassing access-list check enabled

#### Configuration Example -- VPN with IDFW Rule -1

By default, "sysopt connection permit-vpn" is enabled and VPN traffic is exempted from access-list check. In order to apply regular interface based ACL rules for VPN traffic, VPN traffic access-list bypassing needs to be disabled.

In the this example, if the user logs in from outside interface, the IDFW rules will control what network resource he can access. All VPN users are be stored under domain LOCAL. Therefore, it is only meaningful to apply the rules over LOCAL users or object-group containing LOCAL users.

```
! Apply VPN-Filter with bypassing access-list check disabled
no sysopt connection permit-vpn
access-list v1 extended deny ip user LOCAL\idfw any 10.0.0.0 255.255.255.0
access-list v1 extended permit ip user LOCAL\idfw any 20.0.0.0 255.255.255.0
access-group v1 in interface outside >> Control VPN user based on regular IDFW ACLs
```

#### Configuration Example VPN with IDFW Rule -2

By default, "sysopt connection permit-vpn" is enabled, with VPN traffic access bypassing enabled. VPN-filter can be used to apply the IDFW rules on the VPN traffic. VPN-filter with IDFW rules can be defined in CLI username and group-policy.

In the example, when user idfw logs in, he is able to access to network resources in 10.0.00/24 subnet. However, when user user1 logs in, his access to network resources in 10.0.00/24 subnet will be denied. Note that all VPN users will be stored under domain LOCAL. Therefore, it is only meaningful to apply the rules over LOCAL users or object-group containing LOCAL users.

Note: IDFW rules can only be applied to vpn-filter under group-policy and are not available in all the other group-policy features.

```
! Apply VPN-Filter with bypassing access-list check enabled
sysopt connection permit-vpn
access-list v1 extended permit ip user LOCAL\idfw any 10.0.0.0 255.255.255.0
access-list v2 extended deny ip user LOCAL\user1 any 10.0.0.0 255.255.255.0
username user1 password QkBIIVi6IFLEsYv encrypted privilege 0 username user1 attributes
 vpn-group-policy group1 vpn-filter value v2 >> Per user VPN-filter control
username idfw password eEm2dmjMaopcGozT encrypted
username idfw attributes
 vpn-group-policy testgroup vpn-filter value v1

sysopt connection permit-vpn
access-list v1 extended permit ip user LOCAL\idfw any 10.0.0.0 255.255.255.0 access-list
v1 extended deny ip user LOCAL\user1 any 10.0.0.0 255.255.255.0 group-policy group1
internal
group-policy group1 attributes >> Per group VPN-filter control

 vpn-filter value v1
 vpn-tunnel-protocol ikev1 l2tp-ipsec ssl-client ssl-clientless
```

## Monitoring the Identity Firewall

This section contains the following topics:

- [Monitoring AD Agents, page 26](#)
- [Monitoring Groups, page 26](#)

- [Monitoring Memory Usage for the Identity Firewall, page 26](#)
- [Monitoring Users for the Identity Firewall, page 27](#)

## Monitoring AD Agents

You can monitor the AD Agent component of the Identity Firewall.

Use the following options of the **show user-identity** command to obtain troubleshooting information for the AD Agent:

- **show user-identity ad-agent**
- **show user-identity ad-agent statistics**

These commands display the following information about the primary and secondary AD Agents:

- Status of the AD Agents
- Status of the domains
- Statistics for the AD Agents

## Monitoring Groups

You can monitor the user groups configured for the Identity Firewall.

Use the **show user-identity group** command to obtain troubleshooting information for the user groups configured for the Identity Firewall:

displays the list of user groups in the following format:

*domain\group\_name*

## Monitoring Memory Usage for the Identity Firewall

You can monitor the memory usage that the Identity Firewall consumes on the ASA.

Use the **show user-identity memory** command to obtain troubleshooting information for the Identity Firewall:

The command displays the memory usage in bytes of various modules in the Identity Firewall:

- Users
- Groups
- User Stats
- LDAP

The ASA sends an LDAP query for the Active Directory groups configured on the Active Directory server. The Active Directory server authenticates users and generates user logon security logs.

- AD Agent
- Miscellaneous
- Total Memory Usage

**Note**

How you configure the Identity Firewall to retrieve user information from the AD Agent impacts the amount of memory used by the feature. You specify whether the ASA uses **on demand** retrieval or **full download** retrieval. Selecting **On Demand** has the benefit of using less memory as only users of received packets are queried and stored. See [Configuring Identity Options, page 14](#) for a description of these options.

## Monitoring Users for the Identity Firewall

You can display information about all users contained in the IP-user mapping database used by the Identity Firewall.

Use the following options of the **show user-identity** command to obtain troubleshooting information for the AD Agent:

- **show user-identity user all list**
- **show user-identity user active user *domain\user-name* list detail**

These commands display the following information for users:

| <i>domain\user_name</i> | Active Connections | Minutes Idle |
|-------------------------|--------------------|--------------|
|-------------------------|--------------------|--------------|

The default domain name can be the real domain name, a special reserved word, or LOCAL. The Identity Firewall uses the LOCAL domain name for all locally defined user groups or locally defined users (users who log in and authenticate by using a VPN or web portal). When default domain is not specified, the default domain is LOCAL.

The idle time is stored on a per user basis instead of per the IP address of a user.

**Note**

The first three tabs in the

If the commands **user-identity action domain-controller-down *domain\_name* disable-user-identity-rule** is configured and the specified domain is down, or if **user-identity action ad-agent-down disable-user-identity-rule** is configured and AD Agent is down, all the logged on users have the status disabled.

# Feature History for the Identity Firewall

Table 36-1 lists the release history for this feature.

Table 36-1 Feature History for the Identity Firewall

| Feature Name      | Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## CHAPTER 37

# Configuring Management Access

This chapter describes how to access the ASA for system management through Telnet, SSH, and HTTPS (using ASDM), how to authenticate and authorize users, and how to create login banners.

This chapter includes the following sections:

- [Configuring ASA Access for ASDM, Telnet, or SSH, page 37-1](#)
- [Configuring CLI Parameters, page 37-6](#)
- [Configuring ICMP Access, page 37-10](#)
- [Configuring Management Access Over a VPN Tunnel, page 37-12](#)
- [Configuring AAA for System Administrators, page 37-13](#)
- [Feature History for Management Access, page 37-33](#)

**Note**

To access the ASA interface for management access, you do not also need an access list allowing the host IP address. You only need to configure management access according to the sections in this chapter.

## Configuring ASA Access for ASDM, Telnet, or SSH

This section describes how to allow clients to access the ASA using ASDM, Telnet, or SSH and includes the following topics:

- [Licensing Requirements for ASA Access for ASDM, Telnet, or SSH, page 37-1](#)
- [Guidelines and Limitations, page 37-2](#)
- [Configuring Telnet Access, page 37-3](#)
- [Using a Telnet Client, page 37-4](#)
- [Configuring SSH Access, page 37-4](#)
- [Using an SSH Client, page 37-5](#)
- [Configuring HTTPS Access for ASDM, page 37-6](#)

## Licensing Requirements for ASA Access for ASDM, Telnet, or SSH

The following table shows the licensing requirements for this feature:

| Model      | License Requirement |
|------------|---------------------|
| All models | Base License.       |

## Guidelines and Limitations

This section includes the guidelines and limitations for this feature.

### Context Mode Guidelines

Supported in single and multiple context mode.

### Firewall Mode Guidelines

Supported in routed and transparent firewall mode.

### IPv6 Guidelines

Supports IPv6.

### Additional Guidelines

- You cannot use Telnet to the lowest security interface unless you use Telnet inside a VPN tunnel.
- Management access to an interface other than the one from which you entered the ASA is not supported. For example, if your management host is located on the outside interface, you can only initiate a management connection directly to the outside interface. The only exception to this rule is through a VPN connection. See the [“Configuring Management Access Over a VPN Tunnel” section on page 37-12](#).
- The ASA allows:
  - A maximum of 5 concurrent Telnet connections per context, if available, with a maximum of 100 connections divided among all contexts.
  - A maximum of 5 concurrent SSH connections per context, if available, with a maximum of 100 connections divided among all contexts.
  - A maximum of 5 concurrent ASDM instances per context, if available, with a maximum of 32 ASDM instances among all contexts.
- The ASA supports the SSH remote shell functionality provided in SSH Versions 1 and 2 and supports DES and 3DES ciphers.
- XML management over SSL and SSH is not supported.
- (8.4 and later) The SSH default username is no longer supported. You can no longer connect to the ASA using SSH with the **pix** or **asa** username and the login password. To use SSH, you must configure AAA authentication using the **aaa authentication ssh console LOCAL** command; then define a local user by entering the **username** command. If you want to use a AAA server for authentication instead of the local database, we recommend also configuring local authentication as a backup method.

## Configuring Telnet Access

To identify the client IP addresses allowed to connect to the ASA using Telnet, perform the following steps.

### Detailed Steps

|        | Command                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                        |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>telnet</b> <i>source_IP_address mask source_interface</i><br><br><b>Example:</b><br>hostname(config)# telnet 192.168.1.2 255.255.255.255 inside | For each address or subnet, identifies the IP addresses from which the ASA accepts connections.<br><br>If there is only one interface, you can configure Telnet to access that interface as long as the interface has a security level of 100.                                                                                 |
| Step 2 | <b>telnet timeout</b> <i>minutes</i><br><br><b>Example:</b><br>hostname(config)# telnet timeout 30                                                 | Sets the duration for how long a Telnet session can be idle before the ASA disconnects the session.<br><br>Set the timeout from 1 to 1440 minutes. The default is 5 minutes. The default duration is too short in most cases and should be increased until all pre-production testing and troubleshooting have been completed. |

### Examples

The following example shows how to let a host on the inside interface with an address of 192.168.1.2 access the ASA:

```
hostname(config)# telnet 192.168.1.2 255.255.255.255 inside
```

The following example shows how to allow all users on the 192.168.3.0 network to access the ASA on the inside interface:

```
hostname(config)# telnet 192.168.3.0 255.255.255.0 inside
```

## Using a Telnet Client

To gain access to the ASA CLI using Telnet, enter the login password set by the **password** command. If you configure Telnet authentication (see the [“Configuring Authentication for CLI and ASDM Access” section on page 37-19](#)), then enter the username and password defined by the AAA server or local database.

## Configuring SSH Access

To identify the client IP addresses and define a user allowed to connect to the ASA using SSH, perform the following steps.

### Detailed Steps

|               | Command                                                                                                                                                        | Purpose                                                                                                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>crypto key generate rsa modulus</b><br><i>modulus_size</i><br><br><b>Example:</b><br>hostname(config)# crypto key generate rsa<br>modulus 1024              | Generates an RSA key pair, which is required for SSH.<br><br>The modulus value (in bits) is 512, 768, 1024, or 2048. The larger the key modulus size you specify, the longer it takes to generate an RSA key pair. We recommend a value of 1024. |
| <b>Step 2</b> | <b>write memory</b><br><br><b>Example:</b><br>hostname(config)# write memory                                                                                   | Saves the RSA keys to persistent flash memory.                                                                                                                                                                                                   |
| <b>Step 3</b> | <b>aaa authentication ssh console LOCAL</b>                                                                                                                    | Enables local authentication for SSH access. You can alternatively configure authentication using a AAA server. See the <a href="#">“Configuring Authentication for CLI and ASDM Access” section on page 37-19</a> for more information.         |
| <b>Step 4</b> | <b>username</b> <i>username</i> <b>password</b> <i>password</i>                                                                                                | Creates a user in the local database that can be used for SSH access.                                                                                                                                                                            |
| <b>Step 5</b> | <b>ssh</b> <i>source_IP_address</i> <i>mask</i><br><i>source_interface</i><br><br><b>Example:</b><br>hostname(config)# ssh 192.168.3.0<br>255.255.255.0 inside | For each address or subnet, identifies the IP addresses from which the ASA accepts connections, and the interface on which you can SSH. Unlike Telnet, you can SSH on the lowest security level interface.                                       |

|               | Command                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                     |
|---------------|------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 6</b> | (Optional)<br><b>ssh timeout</b> <i>minutes</i><br><br><b>Example:</b><br>hostname(config)# ssh timeout 30       | Sets the duration for how long an SSH session can be idle before the ASA disconnects the session.<br><br>Set the timeout from 1 to 60 minutes. The default is 5 minutes. The default duration is too short in most cases, and should be increased until all pre-production testing and troubleshooting have been completed. |
| <b>Step 7</b> | (Optional)<br><b>ssh version</b> <i>version_number</i><br><br><b>Example:</b><br>hostname(config)# ssh version 2 | Limits access to SSH version 1 or 2. By default, SSH allows both versions 1 and 2.                                                                                                                                                                                                                                          |

## Examples

The following example shows how to generate RSA keys and let a host on the inside interface with an address of 192.168.1.2 access the ASA:

```
hostname(config)# crypto key generate rsa modulus 1024
hostname(config)# write memory
hostname(config)# aaa authentication ssh console LOCAL
WARNING: local database is empty! Use 'username' command to define local users.
hostname(config)# username exampleuser1 password examplepassword1
hostname(config)# ssh 192.168.1.2 255.255.255.255 inside
hostname(config)# ssh timeout 30
```

The following example shows how to allow all users on the 192.168.3.0 network to access the ASA on the inside interface:

```
hostname(config)# ssh 192.168.3.0 255.255.255.0 inside
```

## Using an SSH Client

In the SSH client on your management host, enter the username and password that you configured in the [“Configuring SSH Access” section on page 37-4](#). When starting an SSH session, a dot (.) displays on the ASA console before the following SSH user authentication prompt appears:

```
hostname(config)# .
```

The display of the dot does not affect the functionality of SSH. The dot appears at the console when generating a server key or decrypting a message using private keys during SSH key exchange before user authentication occurs. These tasks can take up to two minutes or longer. The dot is a progress indicator that verifies that the ASA is busy and has not hung.

# Configuring HTTPS Access for ASDM

To use ASDM, you need to enable the HTTPS server, and allow HTTPS connections to the ASA. HTTPS access is enabled as part of the factory default configuration or when you use the **setup** command. This section describes how to manually configure ASDM access.

To configure HTTPS access for ASDM, perform the following steps:

## Detailed Steps

|        | Command                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                      |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>http</b> <i>source_IP_address mask</i><br><i>source_interface</i><br><br><b>Example:</b><br>hostname(config)# http 192.168.1.2<br>255.255.255.255 inside | For each address or subnet, identifies the IP addresses from which the ASA accepts HTTPS connections.                                                                                                                                                        |
| Step 2 | <b>http server enable</b> [ <i>port</i> ]<br><br><b>Example:</b><br>hostname(config)# http server enable 443                                                | Enables the HTTPS server.<br><br>By default, the <i>port</i> is 443. If you change the port number, be sure to include it in the ASDM access URL. For example, if you change the port number to 444, enter the following:<br><br><b>https://10.1.1.1:444</b> |

## Examples

The following example shows how to enable the HTTPS server and let a host on the inside interface with an address of 192.168.1.2 access ASDM:

```
hostname(config)# http server enable
hostname(config)# http 192.168.1.2 255.255.255.255 inside
```

The following example shows how to allow all users on the 192.168.3.0 network to access ASDM on the inside interface:

```
hostname(config)# http 192.168.3.0 255.255.255.0 inside
```

# Configuring CLI Parameters
